PROJECT'ILE, *n.* A body projected, or impelled forward by force, particularly through the air. Thus, a stone thrown from the hand or a sling, an arrow shot from a bow, and a bullet discharged from a cannon, are projectiles while they continue in motion. —2. *Projectiles*, in *mechanical philosophy*, is that branch which treats of the motion of bodies thrown or driven by an impelling force from the surface of the earth, and affected by gravity and the resistance of the air. The theory of the motion of projectiles is a part of the higher mechanics, and has its practical application in the science of gunnery. When a heavy body is projected from the earth it is acted upon by three forces. 1. The projectile force or that by which it was put in motion. 2. The force of gravity, by which it is at every instant pulled towards the earth in a vertical line. 3. The resistance of the air, which acting in the direction opposite to that in which the body is moving, tends at every instant to destroy its motion, or to bring it to rest. The theory, in the first place, does not take into account the resistance of the air, but considers the projectile as moving in a non-resisting medium. On this supposition it is demonstrated that every projectile not projected in a direction perpendicular to the horizon describes the curve of a parabola. The angle which the direction of the initial velocity makes with the horizon is called the *elevation*; the distance to which the projectile goes, estimated in a horizontal direction, is called the *range*, and the time during which it continues in motion is called *the time of flight*. The results which the theory gives, require considerable correction when applied to practice, particularly when the velocity of the projectile is great. This is owing chiefly to the resistance of the air.

Plan; delineation; the representation of something; as, the *projection* of the sphere, which is a representation of the several points or places of the surface of the sphere, and of the circles described upon it upon a transparent plane, placed between the eye and the sphere; or such as they would appear to the eye placed at a given distance. It is a problem of much importance, in consequence of its application to the construction of maps, charts, planispheres, &c. Projections are of several kinds, according to the situations in which the eye is supposed to be placed in respect of the sphere and the plane on which it is to be projected. The most important are the *stereographic*, in which the eye is supposed to be placed on the surface of the sphere; the *orthographic*, in which the eye is supposed to be at an infinite distance; and the *gnomonic*, in which the eye is placed in the centre of the sphere. In *persp.*, *projection* denotes the appearance or representation of an object on the perspective plane.—5. In *a general sense*, a declaration, written or verbal, made by one person to another, which binds the person who makes it, either in honour, conscience, or law, to do or forbear a certain act specified; a declaration which gives to the person to whom it is made, a right to expect or to claim the performance or forbearance of the act. The promise of a visit to my neighbour, gives him a right to expect it, and I am bound in honour and civility to perform the *promise*. Of such a *promise* human laws have no cognizance; but the fulfilment of it is one of the minor moralities, which civility, kindness and strict integrity require to be observed.—2. In *law*, a declaration, verbal or written, made by one person to another for a good or valuable consideration, in the nature of a covenant, by which the promiser binds *himself*, and as the case may be, his *legal representatives*, to do or forbear some act; and gives to the promisee a legal right to demand and enforce a fulfilment.—*Promise* and *offer*. In *Scots law*, an offer is a proposal made by the offerer to the person to whom the offer is addressed, to give or to do something, either gratuitously or on an onerous consideration. A promise is an offer; with this addition, that the promiser, from the nature of his proposal, thinks it unnecessary to wait for the other party's assent, which he takes it for granted will be given as soon as the offer is known. An offerer is not bound till his offer is accepted. A promiser is bound as soon as the promise reaches the party to whom it is made.—3. A binding declaration of something to be done or given for another's benefit; as, the *promise* of a grant of land. A promise may be *absolute* or *conditional; lawful* or *unlawful; express* or *implied*. An *absolute promise* must be fulfilled at all events. The obligation to fulfil a *conditional promise* depends on the performance of the condition. An *unlawful promise* is not binding, because it is void; for it is incompatible with a prior paramount obligation of obedience to the laws. An *express promise*, is one expressed in words or writing. An *implied promise*, is one which reason and justice dictate. If I hire a man to perform a day's labour, without any declaration that I will pay him, the law presumes a *promise* on my part that I will give him a reasonable reward, and will enforce such *implied promise*.—4. Hopes; expectation, or that which affords expectation of future distinction; as, a youth of great *promise*.

My native country was full of youthful *promise*. *Irving*.

—I fear it, I *promise* you. *Shak.*

In the latter example, *promise* is equivalent to *declare*; "I *declare* to you." —4. To *promise one's self*, to be assured or to have strong confidence.

This is called the *press proof.*—In *engraving,* an impression taken from an engraving to prove the state of it during the progress of executing it; also one, of a limited number, taken before the letters to be inserted are engraven on the plate. PROP'ERNESS, *n.* The quality of being proper. [*Little used.*] 2.† Tallness.—3. Perfect form; handsomeness.

PROP'ERTY, *n.* [This seems to be formed directly from *proper*; if not, it is contracted. The Latin is *proprietas*, Fr. *propriété*, from which we have *propriety.*] 1. A peculiar quality of any thing; that which is inherent in a subject, or naturally essential to it. Property is defined by logicians to be a predicable, which denotes something essentially conjoined to the essence of the species. There are enumerated in the books of logic four kinds of property, which are termed "universal but not peculiar;" "peculiar but not universal;" "universal and peculiar;" "universal and peculiar, but not at every time."—*General properties of bodies or of matter*, in natural philosophy, those properties which belong to all bodies which come within our observation, such as *extension, impenetrability, divisibility, figure, porosity, compressibility, dilatability, inertia*, and *gravity*. The first four of these are considered to be *essential* properties of matter.—*Peculiar or specific properties of bodies*, those which belong to particular substances, or to matter in particular states, or which exist in different degrees in different bodies, such as *elasticity, fluidity, hardness, softness, brittleness, tenacity, malleability, ductility*, &c.—2. An acquired or artificial quality; that which is given by art or bestowed by man. The poem has the *properties* which constitute excellence.—3. Quality; disposition.

It is the *property* of an old sinner to find delight in reviewing his own villanies in others. *South.*

4. The exclusive right of possessing, enjoying, and disposing of a thing; ownership. In the beginning of the world, the Creator gave to man dominion over the earth, over the fish of the sea and the fowls of the air, and over every living thing. This is the foundation of man's *property* in the earth and in all its productions. Prior occupancy of land and of wild animals gives to the possessor the *property* of them. The labour of inventing, making, or producing any thing constitutes one of the highest and most indefeasible titles to *property*. *Property* is also acquired by inheritance, by gift, or by purchase. *Property* is sometimes held in common, yet each man's right to his share in common land or stock is exclusively his own. One man may have the *property* of the soil, and another the right of use, by prescription or by purchase.—In *English law*, property is divided into *real* and *personal*, and in *Scots law*, into *heritable* and *movable*. [*See* these terms.] 5. Possession held in one's own right.—6. The thing owned; that to which a person has the legal title, whether in his possession or not. It is one of the greatest blessings of civil society that the *property* of citizens is well secured.—7. An estate, whether in lands, goods, or money; as, a man of large *property* or small *property*.—8. An estate; a farm; a plantation. In this sense, which is common in the United States and in the West Indies, the word has a plural.

The still-houses on the sugar plantations vary in size, according to the fancy of the proprietor or the magnitude of the *property*. *Edwards, W. Indies.*
I shall confine myself to such *properties* as fall within the reach of daily observation. *Ib.*

9. Nearness of right.

Here I disclaim all my paternal care,
Propinquity and *property* of blood. *Shak*

10. Something useful; an appendage; *a theatrical term*.

11.† Propriety.—*Literary property*, the exclusive right of printing, publishing, and making profit by one's own writings; the right which authors have to profit by the sale of their works. [*See* COPYRIGHT.] To render copyright valid, a copy of each new work or every new edition with alterations, is registered at Stationers'-hall, London; and *five* copies in all are demanded, as a privilege, for the libraries of the British museum, Oxford and Cambridge universities, the Advocates' library, Edinburgh, and Trinity college, Dublin.

PROPORTION, *n.* [L. *proportio; pro* and *portio,* part or share. *See* PORTION.] 1. The comparative relation of any one thing to another. Let a man's exertions be in *proportion* to his strength.—2. The identity or similitude of two ratios. *Proportion* differs from *ratio. Ratio* is the relation which determines the quantity of one thing from the quantity of another, without the intervention of a third. *Proportion* is the sameness or likeness of two such relations. Thus, 5 is to 10, as 8 to 16, or A is to B, as C is to D; that is, 5 bears the same relation to 10, as 8 does to 16. Hence, we say, such numbers are in *proportion.* The term proportion is sometimes improperly used for ratio. The ratio between two quantities is expressed by the quotient of one divided by the other: thus, the ratio of 10 to 5 is 2, and the ratio of 16 to 8 is 2. These two equal ratios constitute a proportion, which is expressed by saying, 10 is to 5 as 16 is to 8; or more concisely, 10 : 5 : : 16 : 8. The following is Euclid's definition of proportion: If there be four magnitudes, and if any equimultiples of the first and third, and also any equimultiples of the second and fourth be taken; and if, according as the multiple of the first is greater than that of the second, equal to it, or less, the multiple of the third is also greater than that of the fourth, equal to it, or less; then the first of the magnitudes is said to have to the second, the same ratio that the third has to the fourth. The algebraic definition is: When of four quantities the quotient of the first and second is equal to the quotient of the third and fourth, the first has the same ratio to the second that the third has to the fourth, and the four quantities are called proportionals.

Thus, if $\frac{a}{b} = \frac{c}{d}$, then $a : b : : c : d$.

The first definition is applicable to magnitudes or quantities of all kinds; the second is strictly applicable only to those quantities which are commensurable. When four quantities are proportional, they are proportional also by *alternation,* by *inversion,* by *division,* by *composition,* and by *inversion.* [*See* RATIO.]—3. In *arith.*, a rule by which, when three numbers are given, a fourth number is found, which bears the same relation to the third as the second does to the first.—*Simple proportion,* in *arith.*, may be defined, the equality of the ratio of two quantities to that of two other quantities; and *compound proportion,* the equality of the ratio of two quantities to another ratio, the antecedent and consequent of which are respectively the products of the antecedents, and consequents of two or more ratios. When four numbers are written in the form of a proportion, if the antecedents of the two ratios are the related numbers, the proportion is said to be *direct;* but if the antecedent of the first ratio is the number connected with the consequent of the second, the proportion is *inverse:* thus, in the proportion 8 : 20 : : 12 : 30, if 8 and 12 be the related numbers the proportion is *direct.* Again, in the proportion 4 : 6 : : 10 : 15, if 4 and 15 stand as the related numbers, the proportion is *inverse.* This is also called *reciprocal proportion;* for if one of the ratios be formed of the reciprocals of the given numbers, instead of the numbers themselves, the related numbers would stand as in direct proportion; thus, $\frac{1}{3} : \frac{1}{2} : : 10 : 15$ or $6 : 4 : : \frac{1}{10} : \frac{1}{15}$. [*See* RECIPROCALS, RECIPROCAL RATIO.] It is a property of proportional numbers that the product of the extremes is equal to the product of the means.—4. In *arch.* and *the fine arts,* symmetry; suitableness of one part of a thing in respect of size and dimensions, compared with another, or with the whole of that to which it appertains, as in the human body, a statue, or a building. More particularly, in *arch., proportion* may be defined "The just magnitude of each part, and of each part compared with another, so as to be suitable to the end in view." Much of the beauty of architecture depends upon proportion; or, in other words, that well balanced regulation of the different parts of a structure which affects the eye and mind agreeably, all the members seeming agreeably adjusted to the whole, and the lesser details similarly adjusted to the separate features, or larger features to which they belong.

> Harmony, with every grace,
> Plays in the fair *proportions* of her face. — *Mrs. Carter.*

5. Equal or just share: as, to ascertain the *proportion* of profit to which each partner in a company is entitled.—6. Form; size. [*Little used.*]—7. The relation between unequal things of the same kind, by which their several parts correspond to each other with an equal augmentation and diminution, as in reducing and enlarging figures. [This more properly belongs to *ratio.*]—*Harmonical* or *musical proportion,* is when, of three numbers, the first is to the third as the difference of the first and second to the difference of the second and third. Thus, 2, 3, 6, are in harmonical proportion; for 2 is to 6 as 1 to 3. So also four numbers are harmonical, when the first is to the fourth

as the difference of the first and second is to the difference of the third and fourth. Thus, 24, 16, 12, 9, are harmonical, for 24 : 9 : : 8 : 3.—*Continual proportion* is when every two adjacent terms have the same ratio, or when the consequent of one ratio is the antecedent of the following: thus, 2, 4, 8, 16, &c., are numbers in continual proportion. Such numbers form a geometrical progression.—*Rhythmical proportion*, in *music*, the proportion in relation to time or measure between the notes representing duration.—*Definite proportions*, in *chem*, [*see* DEFINITE, EQUIVALENT.]—*Arithmetical* and *geometrical proportion*. [*See* PROGRESSION, No. 4.]

> That which is morally good is to be desired and *prosecuted.* *Wilkins.*

This word signifies either to *begin* and *carry on*, or simply to *continue* what has been begun. When I say, "I have devised a plan which I have not the courage or means to *prosecute*," the word signifies to *begin to execute.* When we say, "the nation began a war which it had not means to *prosecute*," it signifies to *continue to carry on.* The latter is the genuine sense of the word, but both are well authorized. We *prosecute* any work of the hands or of the head. We *prosecute* a purpose, an enterprise, a work, studies, inquiries, &c.—2. To seek to obtain by legal process; as, to *prosecute* a right in a court of law.—3. To accuse of some crime or breach of law, or to pursue for redress or punishment before a legal tribunal; as, to *prosecute* a man for trespass or for a riot. It is applied to civil suits for damages, as well as to criminal suits, but not to suits for debt. We never say, a man *prosecutes* another on a bond or note, or in assumpsit; but he *prosecutes* his right or claim in an action of debt, detinue, trover, or assumpsit. So we say, a man *prosecutes* another for assault and battery, for a libel or for slander, or for breaking his close. In these cases, *prosecute* signifies to *begin*, and to *continue* a suit. The attorney-general *prosecutes* offenders in the name of the king or of the state, by information or indictment. *Prosecute* differs from *persecute*, as in *law* it is applied to the legal proceedings only, whereas *persecute* implies cruelty, injustice, or oppression.

The institution and carrying on of a suit in a court of law or equity, to obtain some right, or to redress and punish some wrong. The *prosecution* of a claim in chancery is very expensive. Malicious *prosecutions* subject the offender to punishment.—3. The institution or commencement and continuance of a criminal suit; the process of exhibiting formal charges against an offender before a legal tribunal, and pursuing them to final judgment; as, *prosecutions* of the crown or of the state by the attorney or solicitor general. *Prosecutions* may be by presentment, information, or indictment. Thus a Gentile converted to Judaism is a *proselyte;* a Pagan converted to Christianity is a *proselyte;* and we speak familiarly of *proselytes* to the theories of Brown, of Black, or of Lavoisier. The word primarily refers to converts to some religious creed.—*Proselyte of the gate*, among the Jews, one who merely renounced idolatry, and believed in, and worshipped the true God, observing the precepts of the moral law. In the Greek and Latin languages, every syllable had its determinate value or quantity, and verses were constructed by systems of recurring feet, each foot containing a definite number of syllables, possessing a certain quantity and arrangement. The versification of modern European languages, in general, is constructed simply by accent and number of syllables.

After the lapse of the *induciæ* of a summons, if the pursuer does not proceed to call and enrol it, the defender, if he pleases, may put up *protestation*, which is done by delivering to one of the Outer House clerks a note for insertion in the minute book of the court of session specifying the names of the parties, and the date of the summons, with the names of the defender's counsel and agent. This note, which is called a *protestation*, is then inserted in the minute book by the keeper, and thus published or notified to the profession. If within nine free days after its date, a certificate is produced to the minute book keeper, from a depute-clerk of session or his assistant, that the summons, suspension, or advocation has been duly lodged with him for calling, the minute book keeper is bound to *score* the protestation, as it is expressed, and the clerk issuing the certificate is bound to call the summons, &c., regularly and immediately. The Italian *provianda* is probably composed of *pro* and *vivanda*, victuals, from *vivere*, L. *vivo*, to live; and from *vivanda* the French have *viande*, Eng. *viand*. Whether the French *provende* and Norm. *provender* are from the same source, may be doubted. The German *proviant* may be formed from the L. *provideo*. Qu. L. *proventus*. It is said that *provend*, *provender*, originally signified a vessel containing a measure of corn daily given to a horse or other beast. But qu. *N* may be casual in *provender*, as in *messenger*, and the word may be from *provideo*.] 1. Dry food for beasts, as hay, straw, and corn. The *proverb* is true, that light gains make heavy purses; for light gains come often, great gains now and then. *Bacon.*

A proverb presents some striking and familiar image to the mind which by the force of association makes its effect strong and permanent, and thereby often supersedes the necessity of a long discourse or explanation. No country is without its proverbs; some of them no doubt are exceptionable, but the greater part, however quaintly expressed, contain the essence of some moral truth or practical lesson. They are drawn from real life, and are generally the fruit of philosophy grafted on the stem of experience.—2. How many of the troubles and perplexities of life proceed from want of *providence*.—3. In *theol.*, the care and superintendence which God exercises over his creatures. He that acknowledges a creation and denies a *providence*, involves himself in a palpable contradiction; for the same power which caused a thing to exist is necessary to continue its existence. In *England*, this practice was restrained by statutes of Richard II. and Henry IV.

> More sharp and penal laws were devised against *provisors*; it being enacted that whoever disturbs any patron in the presentation to a living by virtue of any papal provision, such *provisor* shall pay fine and ransom to the king at his will, and be imprisoned till he renounces such provision. *Blackstone.*

The Goth. *frod* signifies both wise, prudent, and broken; D. *vroed*, prudent. We see that *prude, prudent*, and *proud* are from the same root. The sense of *brittle* would indicate that these words belong to the same family with the Dan. *bryder*, to break; and the radical elements are the same. The Welsh *pruz* is from tending out or reaching, hence *pryder*, anxiety, a stretching of the mind. The sense of *prude* is probably from stretching, straitness, stiffness; and the sense of *wise* is derivative. *Prudence* is from the same root, implying care, a tension of mind.] A woman of great reserve, coyness, affected stiffness of manners and scrupulous nicety.

PRU'DENCE, *n.* [Fr. from L. *prudentia*. *See* PRUDE.] Wisdom applied to practice. Prudence implies caution in deliberating and consulting on the most suitable means to accomplish valuable purposes, and the exercise of sagacity in discerning and selecting them. Prudence differs from wisdom in this, that prudence implies more caution and reserve than wisdom, or is exercised more in foreseeing and avoiding evil, than in devising and executing that which is good. It is sometimes mere caution or circumspection.

Prudence is principally in reference to actions to be done, and due means, order, season, and method of doing or not doing. *Hale.*

PRU'DENT, *a.* Cautious; circumspect; practically wise; careful of the conse-

The fruits sold in the shops under the name of *prunes*, are the produce of the *Prunus domestica* or common plum. Pruning therefore varies according to the kind of plant or tree to be pruned, and according to the object in view. By means of pruning the bulk and growth of trees and plants may be promoted, or the bulk lessened; the form may be modified, the formation of blossom buds may be promoted; the fruit enlarged, the stem and branches adjusted to the roots, decayed plants or trees renewed, and diseases removed or cured.

PRUNING-HOOK, } *n.* A pruning-
PRUNING-KNIFE, } knife is an instrument used for pruning trees; the blade, which is of no great breadth, is formed of well-tempered steel; it has a straight edge with a narrow point, in order that it may be more easily introduced among crowded branches. Formerly such knives were hooked at the point, and were termed *pruning-hooks.*

PRUNING-SHEARS, *n.* Shears for pruning shrubs, &c., in which one of the blades moves on a pivot, which works in an oblong opening instead of a circular one, by which means a draw cut is produced similar to that with a knife, instead of a crushing cut produced by common shears.

The cherry, bird-cherry, plum, damson, sloe, bullace, and apricot, are all comprehended in the genus, as limited by Linnæus. But in the opinion of some modern botanists the true plums should constitute the genus Prunus, while the others are to be considered as belonging to two other genera, represented by the cherry and the apricot (*Armeniaca* and *Cerasus*). The genus Prunus, thus restricted, contains the garden plum (*P. domestica*) with all its varieties [*see* PRUNE]; the bullace (*P. insititia*); the sloe (*P. spinosa*); and the *P. coccomilia* of Calabria, which has a great reputation in Italy on account of its tonic and febrifugal qualities. PRUSSIATE, *n.* A name first applied to *Prussian blue*, a salt in which the sesquicyanide of iron performs the functions of an acid; but subsequently to numerous salts in which the protocyanide of iron is the acid. It has likewise been applied to various cyanide, as the cyanide of potassium, which has been called prussiate of potassa.

PRUSSIC ACID, *a.* Hydrocyanic acid. The term *prussic acid* is now applied too vaguely and variously to answer the purpose of science. It was first applied to the sesquicyanide of iron, which is the acid of Prussian blue. It was subsequently applied to the protocyanide of iron, which is the acid of the salt erroneously called prussiate of iron and potassa; to the hydrocyanic acid, which, in all probability, forms no salts at all; to the hydroguret of benzile, or the essential oil of bitter almonds, and laurel-cherry, which is not an acid, and of course forms no salts; and to cyanogen, which is not an acid, but a compound basifying and acidifying principle. Each of the above compounds is a valuable medicine. Hydrocyanic acid is frequently used medicinally as a powerful sedative, and anti-irritant, especially to allay cough in phthysis, and to mitigate the spasmodic action of whooping-cough. It requires to be employed with much caution, as it is one of the strongest poisons known.

PULL, *v. t.* [Sax. *pullian;* L. *vello.* Qu. Eth. *balcach.*] 1. To draw; to draw toward one or make an effort to draw; to draw forcibly. *Pull* differs from *draw;* we use *draw* when motion follows the effort, and *pull* is used in the same sense; but we may also *pull* for ever without drawing or moving the thing. This distinction may not be universal. *Pull* is opposed to *push.*

2. To pluck; to gather by drawing or forcing off or out; as, to *pull* fruit; to *pull* flax.—3. To tear; to rend; but in this sense followed by some qualifying word or phrase; as, to *pull in pieces;* to *pull asunder* or *apart.* To *pull in two*, is to separate or tear by violence into two parts.—*To pull down*, to demolish or take in pieces by separating the parts; as, to *pull down* a house.—2. To demolish; to subvert; to destroy.

> In political affairs, as well as mechanical, it is easier to *pull down* than to build up. *Howell.*

3. To bring down; to degrade; to humble.

> To raise the wretched and *pull down* the proud. *Roscommon.*

PULL'EY, *n. plur. Pulleys.* [Fr. *poulie;* Sp. *polea;* L. *polus;* Gr. πολος, from πολεω, to turn.] A small wheel movable about an axis, and having a groove cut in its circumference over which a cord passes. The axle is supported by a box or sheave, called the block, which may either be movable or fixed to a firm support. The pulley is one of the six simple machines or mechanical powers, and is used for raising weights. A single pulley serves merely to change the direction of motion, but several of them may be combined in various ways, by which a mechanical advantage or purchase is gained, greater or less according to their number and the mode of combination. The advan-

tage gained by any combination or system of pulleys is readily computed by comparing the velocity of the weight raised with that of the moving power, according to the principle of virtual velocities. As a system of pulleys has little weight, and lies in a small compass, it is easily carried about, and can be applied for raising weights in a great many cases where other engines cannot be used, and especially in ships. The friction, however, in the pulley is great, particularly when many of them are combined together. A pulley is said to be fixed when the block in which it turns is fixed, and it is said to be movable when the block is movable. In the single fixed pulley (fig. 1.) there is no mechanical advantage, the power and weight being equal. It may be considered as a lever of the first kind with equal arms. In the single movable pulley (fig. 2.) where the cords are parallel there is an equilibrium when the power is to the weight as 1 to 2. It may be considered as a lever of the second kind, in which the distance of the power from the fulcrum is double that of the weight from the fulcrum. In a system of pulleys (figs. 3, 4.) in which

Fig. 2.

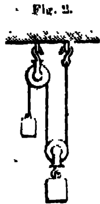

Fig 3

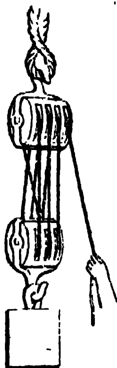

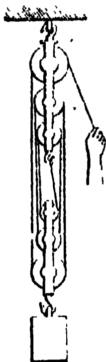

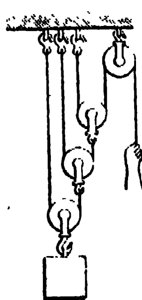

Fig. 4.

the same string passes round any number of pulleys, and the parts of it between the pulleys are parallel, there is an equilibrium when the power is to the weight as 1 to the number of strings at the lower block. In a system in which each pulley hangs by a separate cord (fig. 5.), and the strings are parallel, there is an equilibrium when the power is to the weight as 1 to that power of 2, whose index is the number of movable pulleys. Whatever be the mechanical arrangement of the pulleys and of the ropes, the principle of all pulleys is the same, namely, the transmission of the tension of a rope without sensible diminution so as to obviate the loss of force consequent on rigidity. The word pulley is used also

The L. *bombus* is of the same family, as is the Eng. *bombast;* Ir. *buimpis*, a *pump;* W. *pwmp*, a round mass. The primary sense of the root seems to be to swell.] 1. A machine consisting of a peculiar arrangement of a piston, cylinder and valves, employed for extracting air, or raising water. [*See* AIR PUMP.] Though the forms under which this useful engine is constructed, and the mode in which the power is applied, may be modified in a great variety of ways, there are only three which can be considered as differing from each other in principle. These are the *sucking pump*, the *lifting pump*, and the *forcing pump*. Of these the sucking or common household pump is most in use, and for ordinary purposes the most convenient. The usual form and construction of this pump are shown in the annexed engraving. A piston *a*, is fitted to work airtight within a hollow cylinder or barrel *b, b;* it is moved up and down by a handle connected with the piston rod, and is provided with a valve *c*, opening upwards. At the bottom of the barrel is another valve *f*, also opening upwards, and which covers the orifice of a tube *c, c*, called the suction tube, &c., fixed to the bottom of the barrel, and reaching to the well from which the water is to be raised. When the piston is drawn up from the bottom of the barrel the air below is rarefied, and the pressure of the external air acting on the surface of the water in the well, causes the water to rise in the suction tube until the equilibrium is restored. After a few strokes the water will get into the barrel, the air below the piston having escaped through the piston valve *c*. By continuing the strokes, the water will get above the piston, and be raised along with it to the cistern *d*, at the top of the barrel, where it is discharged by a spout. In this pump the water will rise after the piston to the height of about thirty feet above the level of the water in the well, a column of about thirty feet of water being a balance for the pressure of the atmosphere, but the water which gets above the piston may be raised to any convenient height. The *lifting pump*, properly so called, has the piston in the lower barrel, and raises the water through the whole distance by forcing it upward without the agency of the atmosphere. The *forcing pump* differs from both these in having its piston solid, or without a valve, and also in having a side pipe with a valve opening outwards, through which the water is forced to any height required, or against any pressure that may oppose it. In such pumps the *plunger* is frequently employed instead of the ordinary piston; this arrangement is represented in the accompanying engraving, which is a section of the feed pump of a steam engine. The plunger *a*, works airtight through a stuffing box *b*, at the

Sucking Pump.

top of the barrel, and on being raised produces a vacuum in the pump barrel into which the water rushes by the pipe *c*, and is discharged, on the descent of the plunger through the pipe *d*, the valves, *e* and *f*, serving to intercept the

Force Pump of Steam Engine.

return of the water at each stroke. The side pipe *d*, however, requires the addition of an air-vessel, [*See* AIR VESSEL,] to produce a constant stream. —*Chain-pump* is a chain equipped with a sufficient number of valves at proper distances, which working on two wheels, passes down through one tube and returns through another.—2. PU'NICA, *n.* A genus of plants belonging to the nat. order Myrtaceæ. It consists only of a single species, the celebrated pomegranate (*P. granatum*), with a dwarf variety, which is sometimes considered a distinct species. The pomegranate has from the earliest periods formed an object of attraction in the countries from Syria to the north of India, where it grows in perfection, as well as in the north of Africa; and this, as well from its shining dark-green foliage as from its conspicuous flowers, of which the flower cup and petals are both of a crimson colour, while its large red-coloured fruit, filled with juicy pleasant-flavoured pulp, which covers its numerous seeds, makes it an object of desire in hot countries. [*See* Pomegranate.]

To pain; to afflict with pain, loss, or calamity for a crime or fault; primarily, to afflict with bodily pain, as to *punish* a thief with pillory or stripes; but the word is applied also to affliction by loss of property, by transportation, banishment, seclusion from society, &c. The laws require murderers to be *punished* with death. Other offenders are to be *punished* with fines, imprisonment, hard labour, &c. God *punishes* men for their sins with calamities personal and national.—2. To chastise; as, a father *punishes* his child for disobedience.—3. PUN'ISHMENT, *n.* Any pain or suffering inflicted on a person for a crime or offence, by the authority to which the offender is subject, either by the constitution of God or of civil society. The *punishment* of the faults and offences of children by the parent, is by virtue of the right of government with which the parent is invested by God himself. This species of *punishment* is *chastisement* or *correction*. The *punishment* of crimes against the laws is inflicted by the supreme power of the state in virtue of the right of government, vested in the prince or legislature. The right of *punishment* belongs only to persons clothed with authority. Pain, loss, or evil wilfully inflicted on another for his crimes or offences by a private unauthorized person, is *revenge* rather than *punishment*. *Capital punishments* reach the life of the criminal.

Of *secondary punishments*, some consist in exile or transportation, others in loss of liberty by imprisonment; some extend to confiscation by forfeiture of lands and goods, others induce a disability of holding offices, of being heirs and the like. The real objects of punishment may be classed as follows:—1. The interests of society consisting in its security from the injury to person or property occasioned by the crime, and its moral and religious improvement. 2. The reformation of the offender. The security of society is attained by punishment in four ways. 1. By forcibly preventing the offender from repeating his offence, as by death, mutilation, or perpetual imprisonment. 2. By reforming the habits of the offender, and thereby taking away the desire. 3. By deterring the offender from repetition by the fear of fresh punishment. 4. By deterring others through example, which is the chief practical end of all legal inflictions. Divine *punishments* are doubtless designed to secure obedience to divine laws, and uphold the moral order of created intelligent beings.

The rewards and *punishments* of another life, which the Almighty has established as the enforcements of his law, are of weight enough to determine the choice against whatever pleasure or pain this life can show. *Locke.*

PU'PA, or **PU'PE**, *n.* [L. supra.] In *entom.*, a term applied to the third stage of existence of an insect, the egg being the first stage, and the larva or caterpillar the second. In

Pupa and Caterpillar of Peacock Butterfly (Vanessa Io).

this pupa we can trace most of the parts of the caterpillar with an addition of other parts (in a more or less rudimentary state) which are peculiar to the perfect insect. object, and hence to obtain. In law Latin, *purchase*, the noun, was written *purchacium*. The legal use of the word in obtaining writs, shows best its true origin; to *purchase* a writ, is to *sue out* a writ, that is, to seek it out; for *sue*, *seek*, and L. *sequor*, are all of one origin, and synonymous with *chase*. PUTREFAC'TION, *n.* [Fr. from L. *putrefactio; putris*, putrid, and *facio*, to make.] The spontaneous decomposition of animal and vegetable substances, attended by the evolution of fetid gases. By this process, such substances are reduced either to their original separate elements, or to much more simple compounds. The putrefaction, or putrefactive fermentation of animal substances, is usually attended by more fetid and noxious exhalations than those arising from vegetable products, arising chiefly from the more abundant presence of nitrogen in the former. The formation of ammonia, or of ammoniacal compounds, is a characteristic of most cases of animal putrefaction, while other combinations of hydrogen are also formed, especially carburetted hydrogen, together with complicated and often highly infectious vapours or gases, in which sulphur and phosphorus are frequently discerned. These putrefactive effluvia are for the most part easily decomposed or rendered innocuous by the agency of chlorine: hence the importance of that substance as a powerful and rapidly acting disinfectant. The rapidity of putrefaction and the nature of its products, are to a great extent influenced by temperature, moisture, and access of air. A temperature between 60° and 80°, a due degree of humidity and free access of air, are the circumstances under which it proceeds most rapidly. Hence the abstraction of the air, and water, or humidity, or its fixation by cold, by salt, sugar, spices, &c., will counteract the process of putrefaction. [*See* FERMENTATION, DECOMPOSITION.]

An instrument for measuring degrees of heat above those indicated by the mercurial thermometer; as, the *pyrometer* of Wedgewood. By measuring a cylindrical piece of fine porcelain clay (which may be done with great accuracy, by observing the depth to which it will sink between two scales of metal inclined to each other under a small angle), and then subjecting it to the heat of a furnace, and applying the scale again to it when cold, an indication of the degree of heat to which it has been subjected is given by the amount of its contraction. The Zero of Wedgewood's pyrometer corresponds to 1077 and a fraction on Fahrenheit's, one degree of the former equals 130 of the latter, and the range of the former includes about 31200 degrees on the latter. Other pyrometers for measuring the heat of furnaces are now in use, as the platina pyrometer of Guyton, and that of Daniell.

Q

Q is the seventeenth letter of the English Alphabet; an articulation borrowed from the oriental *koph* or *qoph*, Ch. and Heb. ק, Samaritan ᑭ, Syriac ܩ, Arabic ق, *kaf.* It is supposed to be an articulation more deeply guttural than that of K; indeed, it may have been pronounced as we pronounce *qu*; for we observe that in the Latin language, from which the moderns have borrowed the letter, it is always followed by *u*, as it is in English. This letter is not in the Greek alphabet. In our mother tongue, the Anglo-Saxon, this letter is not used; but in the place of *qu*, *cu*, or more generally, *cw* is used; as in *cwic*, quick; *cwen*, queen. This letter is superfluous; for *ku* or *koo*, in English, have precisely the same sounds as *qu*. It is alleged that in expressing *q*, the cheeks are contracted, and the lips put into a canular form, for the passage of the breath; circumstances which distinguish it from *k*. This appears to be a mistake. This position of the organs is entirely owing to the following letter *u*; and *kuestion* and *question* are pronounced precisely alike, and with the same configuration of the organs. For *qu* in English, the Dutch use *kw*, the Germans *qu*, the Swedes and the Danes *qv*, which answer to our *kw*. The Gothic has a character which answers to *qu*. It appears then that *q* is precisely *k*, with this difference in use, that *q* is always followed by *u* in English, and *k* is not. Q never ends an English word. Its name *cue*, is said to be from the French *queue*, a tail. As a numeral, Q stands for 500, and with a dash, Q̄, for 500,000. Used as an abbreviation, Q. stands for *quantity* or *quantum*; as, among *physicians*, *q. pl. quantum placet*, as much as you please; *q. s. quantum sufficit*, as much as is required, or as is sufficient. Q. V. stand for *quantum vis*, as much as you will; or *quod vide*, which see; Q. D. for *quasi dictum*, as if it were said. Among *mathematicians*, Q. E. D. stand for *quod erat demonstrandum*, which was to be demonstrated; Q. E. F. *quod erat faciendum*, which was to be done. In *the notes of the ancients*, Q. stands for *Quintus* or *Quintius*; *Quint.* for *Quintilius*; and *Quæs.* for *quæstor*. In English, Q. is an abbreviation for *question*. Qy. or Qu. for *query*.

quadrant, an arc of forty-five degrees is made to serve the same purpose as an arc of ninety degrees. *Hadley's quadrant*, in its principle and application, is the same as the sextant, by which it has been superseded. [*See* SEXTANT.] For astronomical purposes the quadrant has, of late years, been entirely superseded by the *mural circle*, it having been found that the circle, on account of the symmetry of its form and the advantage which it possesses of allowing the readings to be made at different parts of the limb, is an instrument much more to be relied on.—*Quadrant*, in *gunnery*, or the *gunner's square*, an instrument used for elevating and pointing cannon, mortars, &c. It consists of a slender rod of very light wood, serving as an index, terminated by a small pith-ball, and suspended from the upper part of an upright stem of wood, the lower end of which is fitted to a hole in the upper surface of the conductor of an electric machine. An ivory semicircle or quadrant is affixed to the stem, having its centre coinciding with the axis of motion of the rod. When the instrument is electrified, by being placed on the electrified conductor, the index is made to diverge from the stem by repulsion, and the number of degrees which it passes over on the semicircle indicates the amount of electricity with which the apparatus is charged.

Quadratic equations are of two kinds, *incomplete*, or *pure*, and *complete*, or *adfected*. The incomplete equation is that which contains only terms affected by the square, and not by the simple power of the unknown quantity; as, $ax^2 = b$. The complete or *adfected* quadratic equation consists of three terms containing the square of the unknown quantity in one, the simple power in another, and the known quantity in a third. Its general form is $ax^2 + bx = c$, and it is always reducible to the form $x^2 \pm ax = \pm b$. Every quadratic equation has necessarily two roots or values of the unknown quantity.

QUAD'RATURE, *n.* [L. *quadratura*.] 1. The act of squaring; the reducing of a figure to a square. Thus the finding of a square which shall contain just as much area as a circle or a triangle, is the *quadrature* of that circle or triangle. The quadrature of the circle is a problem of great celebrity in the history of mathematical science. The whole circular area being equal to the rectangle under the radius, and a straight line equal to half the circumference, the quadrature would be obtained if the length of the circumference were assigned; and hence the particular object aimed at in attempting to square the circle is the determination of the ratio of the circumference to the diameter. This ratio can only be expressed by infinite series. The method of *quadratures* forms a branch of the Integral Calculus.—2. A quadrate; a square.—3. In *astron.*, the aspect of the moon when distant from the sun ninety degrees or a quarter of the circle; or when the moon is at an equal distance from the points of conjunction and opposition.—*Quadrature of curves*, in *math.*, the finding of rectilineal figures containing the same areas as figures bounded by curved lines.

They climb trees with facility, but they do not stand or walk erect except with difficulty. The liberty of their fore arms, and the complication of their hands, enable them to perform many actions and gestures similar to those of man. QUA'KER, *n.* One that quakes; but usually applied to one of the religious sect called the *Society of Friends.* This sect had its origin in England about the middle of the seventeenth century. Its founder was George Fox, a native of Drayton in Leicestershire. He proposed but few articles of faith, insisting chiefly on moral virtue, natural charity, the love of God, and a deep attention to the inward motions and secret operations of the Spirit. The quakers reject all sacraments, and they appoint no *order* of ministers, but consider the instruction and edification of their congregations to be the province of any person of either sex, who conceives himself or herself to be called to the service. When satisfied of their being thus divinely qualified, they are acknowledged ministers; but the Quakers believe such can only exercise their gift acceptably, or profitably, by the assistance of the Holy Spirit at the time. They exhibit great sobriety of behaviour, a singular probity and uprightness in their dealings, a great frugality at their tables, and a remarkable plainness and simplicity in their dress. They refuse to take judicial oaths, but from these the law exempts them. The name, *quakers,* was given in reproach, by a persecuting Justice, because Fox admonished him to *tremble* at the word of the Lord; and on account of some of them being seen to tremble while preaching—but it was never adopted by the Society.

QUAN'TITY, *n.* [Fr. *quantité*; from L. *quantitas*, from *quantus*, how much, or as much as; Pers. *chand*, how much; *chandi*, quantity.] 1. That property of any thing which may be increased or diminished. This definition is defective, and as applicable to many other properties as to quantity. A definition strictly philosophical cannot be given. In common usage, *quantity* is a mass or collection of matter of indeterminate dimensions or weight, but consisting of particles which cannot be distinguished, or which are not customarily distinguished, or which are considered in the aggregate. Thus we say, a *quantity* of earth, a *quantity* of water, a *quantity* of air, of light, of heat, of iron, of wood, of timber, of corn, of paper. But we do not say, a *quantity* of men, or of horses, or of houses; for as these are considered as separate individuals or beings, we call an assemblage of them, a *number* or *multitude*. Quantity is distinguished into *continued* and *discrete*. It is continued when the parts are connected together, and is then called magnitude, which is the object of geometry. It is discrete when the parts have an unconnected and independent existence, forming multitude or number, which is the object of arithmetic.—2. An indefinite extent of space.—3. A portion or part.

If I were sawed into *quantities*.† *Shak.*

4. A large portion; as, a medicine taken in *quantities*, that is, in *large quantities*.—5. In *math.*, any thing which can be multiplied, divided, or measured. Thus mathematics is called the science of quantity. In algebra, quantities are *known* and *unknown*. *Known quantities* are usually represented by the first letters of the alphabet, as a, b, c, and *unknown quantities* are expressed by the last letters, x, y, z, &c. Letters thus used to represent quantities are themselves called quantities. A simple quantity is expressed by one term, as $+a$, or $-abc$; a compound is expressed by more terms than one, connected by the signs, $+$ plus, or $-$ minus, as $a+b$, or $a-b+c$. Quantities which have the sign $+$ prefixed, are called *positive* or *affirmative*; those which have the sign $-$ prefixed are called *negative*.—*Similar quantities* are such as consist of the same letters, and the same powers of the letters; as abc, $-3\ abc$, $+6\ abc$, $-9\ abc$. *Unlike* or *dissimilar quantities* are those which consist of different combinations of letters; as ab, ab^2, $3\ abc$, $4\ xy$, &c.—6. In *gram.*, the measure of a syllable; that which determines the time in which it is pronounced.—7. In *logic*, a category, universal, or predicament; a general conception.—8. In *music*, the relative duration of a note or syllable.—*Quantity of matter*, in a body, is the measure arising from the joint consideration of its magnitude and density. Or the quantity of matter in a body is proportional to the magnitude and density of the body conjointly, and is measured by its absolute weight. [*See* MASS.] *Quantity of motion*, in a body, is used synonymously with *momentum*, to denote the product of the quantity of matter in the moving body by its velocity.

The Fr. *carrière* signifies not only a quarry, but a *career*, *course*, race, from the L. *curro*, which cannot be from squaring. If the sense was a pit, it may be referred to the Heb. A special commission of justices. A justice of the peace is of the *quorum*, when his commission expresses that he is one of those whose presence is necessary to constitute a bench, as at quarter-sessions. The term *quorum* is derived from the words used in the Latin form of the commission issued to justices of the peace; in which the expression occurred, "*quorum unum A. B. esse volumus*," "of whom we will that A. B. be one;" thus rendering it necessary that certain individuals (said to be of the quorum) should be present at the transaction of business. Hence when in an assembly, committees, &c., it is necessary that a certain number should be present to give validity to its acts, that number is generally said to constitute a quorum.

Proceedings under it are prosecuted before the judges of the court of king's (queen's) bench, and the defendant is called upon to show by what warrant (*quo warranto*) he exercises the office, liberty, or franchise in question. The writ itself is fallen into disuse, but the same end is attained by the attorney-general filing an information in the nature of a *quo warranto.*

R

R IS the eighteenth letter of the English Alphabet, and an articulation *sui generis*, having little or no resemblance in pronunciation to any other letter. But from the position of the tongue in uttering it, it is commutable with *l*, into which letter it is changed in many words by the Spaniards and Portuguese, and some other nations; as *l* is also changed into *r*. It is numbered among the liquids and semi-vowels, and is sometimes called the canine letter. It is uttered with a guttural extrusion of the breath, and in some words, particularly at the end or after a labial and a dental letter, with a sort of quivering motion or slight jar of the tongue. Its English uses, which are uniform, may be understood by the customary pronunciation of *rod, room, rose, bar, bare, barren, disturb, catarrh, free, brad, pride, drip, drag, drown.* In words which we have received from the Greek language, we follow the Latins, who wrote *h* after *r*, as the representative of the aspirated sound with which this letter was pronounced by the Greeks. It is the same in the Welsh language. But as the letter is not aspirated in English, *h* is entirely superfluous; *rhapsody, rheum, rhetoric* being pronounced *rapsody, reum, retoric.* As an abbreviation, R. in English, stands for *rex*, king, as George R., or for *regina*, queen; as Victoria R., also for *royal;* as R. N., Royal Navy; R. A., Royal Academy or Academician; R. M., Royal Marines. R. M. also stand for Ready Money. In the notes of the ancients, R. or RO. stands for *Roma;* R. C. for *Romana civitas;* R. G. C. for *rei gerendæ causa;* R. F. E. D. for *recte factum et dictum;* R. G. F. for *regius filius;* R. P. *respublica*, or *Romani principes.* As a numeral, R, in Roman authors stands for 80, and with a dash over it, R̄, for 80,000. But in Greek, ρ, with a small mark over it, thus ρ́, signifies 100, and with the same mark under it, it denoted 1000 × 100, or 100,000. In Hebrew, ר denoted 200, and with two horizontal points

over it, $\div$, 1000 $\times$ 200, or 200,000. Among physicians, R, or ℞ stands for *recipe*, take.

Radiant heat. When a hot body is suspended in the air, a quantity of heat is emitted in all directions by its surface, passing off in right lines like the radii of a circle. The heat so emitted is termed *radiant heat*, and its quantity is greatly dependent upon the nature of the heated surface. It is smallest from polished metallic surfaces, and greatest from rough and unmetallic surfaces.—*Radiant point*, in *optics*, the point from which rays proceed; also called the *radiating point*.—*Radiant flower*, in *bot* [*See* RADIATE.]—*Radiant*, in *her.*, is an epithet for a charge when it is represented with rays or beams about it.

Its intensity in a vacuum is inversely as the square of the distance from the radiating point.—*Solar radiation*, the heat which the earth receives from the sun.—*Terrestrial radiation*, the heat which escapes from the earth into the regions of space.

RĂD'ICAL, *a.* [Fr. from L. *radicalis*, from *radix*, root. *See* RACE and RAY.] 1. The known radicals of acids are certain compounds of carbon and oxygen, cyanogen, mellone, benzule, cinnamule, salicule, acetule, and formule. The radicals forming bases are amide, ethule, methule, cetule, amule, and glycerule.—*Compound radicals*, a certain class of compound bodies possessing the property of uniting with the elements, and of forming with them combinations which are analogous in their properties to the combinations of two simple bodies; combinations, therefore, in which the elementary body may be removed, and its place occupied by the equivalent quantities of other simple bodies. The compound radicals are capable of uniting with each other; they form, with oxygen and sulphur, acids, and bases; many of them unite with hydrogen producing hydracids.—*Radical quantities*, in *alge.*, quantities whose roots may be accurately expressed in numbers. The term is sometimes extended to all quantities under the radical sign.—*Radical sign*, the sign $\sqrt{}$ placed before any quantity, denoting that its root is to be extracted; thus, $\sqrt{a}$ or $\sqrt{a+b}$. To distinguish the particular root to be extracted a number is prefixed to the sign: thus $\sqrt[2]{}$, $\sqrt[3]{}$, $\sqrt[4]{}$, &c., denote, respectively, the square root, cube root, fourth root, &c. In the case of the square root, however, the number is usually omitted, and merely the sign $\sqrt{}$ written. Fractional exponents are frequently used instead of the radical sign, in which case the index of the quantity forms the numerator, and the root to be extracted the denominator: thus, $x^{\frac{2}{3}}$ is equivalent to $\sqrt[3]{x^2}$.

It is a general radius to the curve, and has the addition of *vector* [Lat. a carrier], because it is imagined to carry forward the body to which it is attached. The earth, for example, moves in an elliptic orbit, of which the sun (the centre of force) is in one of the foci; and of consequence the radius vector is continually increasing in length during her course from the perihelion to the aphelion, and decreasing in the same proportion in the progress of her return. RĂGMAN'S-ROLL, *n.* The name of the collection of those instruments by which the nobility and gentry of Scotland were constrained to subscribe allegiance to Edward I. of England in 1296, and which were more particularly recorded in four large rolls of parchment, consisting of thirty-five pieces sewed together, kept in the Tower of London. In *diplomatic lan.*, *ragman* imports an indenture or other legal deed executed under the seals of the parties. Hence the origin of the term.

RĂGOO', **RĂGGUT**, *n.* [Fr. *ragout*; Arm. *ragoud*.] A sauce or seasoning for exciting a languid appetite; or a high seasoned dish, prepared with fish, flesh, greens, and the like, stewed with salt, pepper, cloves, &c.

It is of a gray colour, the texture obscurely laminar or rather fibrous, the laminæ consisting of a congeries of grains of a quartzy appearance, coarse and rough. It effervesces with acids, and gives fire with steel. It is used for a whetstone without oil or water, for sharpening coarse cutting tools. It is abundant in Kent, at Newcastle, in Northumberland, and at Rowley in Staffordshire.

RĂGU'LY, **RĂGU'LED**, **RĂGU'LATED**, *a.* In *her.*, terms used to express any ordinary, that is jagged or notched in an irregular manner. A *cross raguled* seems to be made up of two trunks of trees without their branches, of which they show only the stumps.

Thus, in a door, the horizontal pieces between which the panels lie are called *rails*, whilst the vertical pieces between which the panels are inserted are called *styles*. The same name is given to those pieces that lie under or over the compartments of balustrades, &c. In short, the term *rails* is applied to all pieces lying in a horizontal direction.—3. A series of posts or balusters connected by cross beams, bars, or rods, for enclosure, &c. More usually termed a *railing*.—4. They are now almost universally formed of wrought iron bars, (though formerly made sometimes of wood and sometimes of cast iron) laid in continuous and uninterrupted lines, and carried, at short intervals, upon cast iron supports

or *chairs*, resting either upon transverse timber *sleepers* or upon blocks of stone. The annexed figures show some of the most common forms of section of these bars and of their supports. Fig. 4, which is the form employed by Mr. Brunel in the Great Western Railway, rests on continuous longitudinal timber bearings without the intervention of chairs.

RAILWAY, } *n.* [*rail* and *way*, or
RAILROAD, } *road.*] A road or way having parallel tracks along it, formed of wood or iron, on which the wheels of carriages are made to run in order to lessen friction. These tracks were originally formed of wooden beams called rails, and the wheels of the waggons were cylindrical, and had flanges on one side of the periphery, which confined them to the tracks. The wooden rails were succeeded by iron plates, with flanges or upturned ledges along one side, to prevent the wheels leaving them. These were termed *plate* rails, and are now little used, being superseded by the *edge* rails of the modern railway. The wooden rails and plate rails were chiefly used for the accommodation of coal waggons called *trams*, from which circumstance they are frequently termed *tram roads*, or *tram ways*. The modern railway consists of one or more series of pairs of iron beams or girders called rails, laid parallel to each other, and several feet apart. The width between the rails is called the *gauge*. The *narrow gauge* measures 4 feet 8½ inches between the rails; the *broad gauge* 7 feet. A pair of parallel rails constitutes a *single line* of railway, two pairs, a *double line*, and so on; the width between the lines is generally 6 feet. The rails are supported at a little height above the general surface by iron pedestals called *chairs*, which again are firmly fixed to wooden or stone supports called *sleepers*, placed at intervals and imbedded in the material of the roadway. A railway, in general, approaches as nearly to a straight line between its two extremes or *termini* as the nature of the country and the necessities of the intermediate traffic will permit. It is carried over valleys, either by *embankments* or *viaducts*, and through hills or elevated ground by deep trenches called *cuttings*, or by tunnels. In favourable cases the surface line of the railway is so adjusted that the materials excavated from the cuttings will just serve to form the embankments. Such a line is termed the *balancing* line. Should the excavated material be in excess it is termed *spoil*, and deposited in a convenient place, where it forms a *spoil bank;* but should it be in too small quantity to form the embankment, recourse is had to an excavation along the sides of the site of the latter to supply the deficiency. This is termed *side cutting*. The balancing line or surface line of the railway may or may not be level, and its various slopes are termed *gradients*, and the arrangement of the rises and falls is termed the *grading* of the line. A very steep ascent is termed an *incline*. When the line is formed its surface is covered with broken stones or clean gravel called *ballasting*, and in this the wooden *sleepers*, or stone blocks for sustaining the rails, are imbedded. In their simplest form sleepers are pieces of timber 5 or 6 inches by 9 or 12 inches broad, and 9 or 10 feet long, laid across the line at about 3 feet apart from centre to centre, and to them the chairs which sustain the rails are spiked. Sometimes longitudinal wooden sleepers are used along with the transverse sleepers. These consist of beams laid under the rails and secured to the transverse sleepers. When such are used chairs are frequently dispensed with, the rails being formed with a flange at bottom which is fastened directly to the wooden beam. When the railway is thus completed, the work is called the *permanent way*. In the railway of a single line of rail, it is necessary to make provision for permitting meeting carriages to pass each other by means of *sidings*, which are short additional railways laid at the side of the main line, and so connected with it at each extremity that a carriage can pass into the siding in place of proceeding along the main line. In double lines, in addition to sidings, which are in them also required, it is necessary to provide for carriages crossing from one line to another. The change in the direction of the carriage, in both cases, is effected by switches and turntables. The annexed cut shows a system of rails arranged for the junction of one double line of rails with another, and known as a *main-line junction.*

Junction Rails.

a a, b b, switches or movable rails connected by rods to the reversing handles *c c*; *a a*, single crossings, the extremities of the rails being formed so as to clear and guide the flanges of the wheels; *d d*, double crossings, for the same purpose, with guard or check rails, to assist in guiding the wheels by their flanges through the crossings. [See SWITCH.]

The various places along the line of railway, where carriages stop for taking up or depositing goods or passengers, are termed *stations*, with the prefix of *goods* or *passengers*, as they are allotted to the one or the other; and they are termed road stations, when they occur at the crossing of a public road, where goods or passengers are transferred to other kinds of conveyance. Where warehouses are attached they are called *dépôts*. At the extremities of the railway, or the *termini*, compartments of the stations are generally allotted to goods and passenger traffic, with branches from the main line carried to each. At stations are *turnplates*, or *turntables*, and other contrivances for removing carriages from one line to another. Either horse or steam power is applied to move the carriages on a railway. When horse power is used, the part between the rails is formed into a road on which the animal walks and drags after it the carriages. Steam power is employed in three different ways. First, the steam engine is mounted on a framework, with wheels made to run upon the rails. The engine is then called a *locomotive engine*, and its pressure on the rails generates a tractive force by which it is enabled to move at a high rate of velocity, and to drag great loads after it. 2nd. A fixed engine is employed to give motion to a rope by which the carriages are dragged along, the rope being either an endless rope stretched over pulleys, or one which winds and unwinds on a cylinder. Such engines are termed *stationary* engines, and are used chiefly on inclined planes, where the ascent is too steep for the locomotive engine. 3rd,

Engines are placed at intervals along the line, and employed to exhaust the air in a tube laid between the rails by working air-pumps; the tube is fitted with an air tight piston and provided with a longitudinal slit, through which a projection from the piston passes, and can be connected with the carriages outside. The slit is covered with a valve of peculiar construction. When the air is exhausted in the tube in front of the piston the atmospheric pressure forces the piston forward, and along with it the carriages, the valve opening to allow the passage of the projecting connecting part, and closing immediately behind it. This is called the *atmospheric railway*.

RĀIMENT, *n.* [for *arrayment*; Norm. *araer*, to *array*; *araies*, array, apparel. *See* ARRAY and RAY.] 1. Clothing in general, vestments; vesture; garments; Gen. xxiv.; Deut. viii.

RĀIN, *v. i.* [Sax. *hregnan, regnan, renian, rinan*, to rain; D. and G. *regen*, rain; D. *regenen*, to rain; Dan. *regn*, rain; *regner*, to rain; G. *beregnen*, to rain on. It seems that *rain* is contracted from *regen*. It is the Gr. βρέχω, to rain, to water, which we retain in *brook*, and the Latins, by dropping the prefix, in *rigo, irrigo*, to *irrigate*. The primary sense is to pour out, to drive forth, Ar. *baraka*, coinciding with Heb. Ch. and Syr. ברך, *barak*.] 1. To fall in drops from the clouds, as water; used mostly with *it* for a nominative; as, *it rains; it* will *rain; it rained*, or *it* has *rained*.—2. To fall or drop like rain; as, tears *rained* at their eyes.

RĀIN, *v. t.* To pour or shower down from the upper regions, like rain from the clouds.

Then said the Lord to Moses, Behold, I will *rain* bread from heaven for you; Exod. xvi.

God shall cast the fury of his wrath upon him, and shall *rain* it upon him while he is eating; Job xx.

Upon the wicked he shall *rain* snares, fire, and brimstone, and a horrible tempest; Ps. xi.

RĀIN, *n* [Sax. *rægn, regn, ren.*] The descent of water in drops from the clouds; or the water thus falling. *Rain* is distinguished from *mist*, by the size of the drops, which are distinctly visible. When water falls in very small drops or particles, we call it *mist*, and *fog* is composed of particles so fine as to be not only indistinguishable, but to float or be suspended in the air. Rain depends upon the formation and dissolution of clouds. The humidity suspended in the atmosphere, which forms clouds, and is deposited in rain, is derived from the evaporation of water, partly from land, but chiefly from the vast expanse of the ocean. According to Dr. Hutton, the capacity of the air for moisture increases with the temperature, but in a much higher ratio than the temperature; and hence, it follows that, if two equal portions of air at different temperatures, both completely saturated with moisture, are mingled together, a precipitation of rain must take place in consequence of the mixture, which will have the mean temperature of the two portions, being unable to sustain the mean quantity of vapour. The average quantity of rain which falls in a year at any given place depends on a great variety of circumstances; as, latitude, proximity to the sea; elevation of the region, configuration of the country, and mountain ranges, exposure to the prevailing winds, &c.

RĀINBAT, or **RĀINBEAT,†** *a.* Beaten or injured by the rain.

RĀINBOW, *n.* A bow, or an arc of a circle, consisting of all the colours formed by the refraction and reflection of rays of light from drops of rain or vapour, appearing in the part of the hemisphere opposite to the sun. When the sun is at the horizon, the rainbow is a semicircle. The rainbow is called also *iris*. This well known meteor presents, when perfect, the appearance of two concentric arches; the inner being called the *primary*, and the outer the *secondary* rainbow. Each is formed of the colours of the solar spectrum, but the colours are arranged in the reversed order, the red forming the exterior ring of the primary bow, and the interior of the secondary. The primary bow is formed by the sun's rays entering the upper part of the falling drops of rain, and undergoing two refractions and one reflection; and the secondary, by the sun's rays entering the under part of the drops, and undergoing two refractions and two reflections. Hence, the colours of the secondary bow are fainter than those of the primary. The moon sometimes forms a bow or arch of light, more faint than that formed by the sun, and called *lunar rainbow*. Similar bows at sea are called *marine rainbows*, or *sea bows*.

RĀINBOWED, *a.* Formed with a rainbow.

RĀINE,† *n.* [Fr *règne*.] Region.

Of the wide ayre her way does cut amaine.

RĀIN GAUGE, *n.* An instrument for measuring or *gauging* the quantity of rain which falls at a given place. *Rain gauges* are variously constructed. One convenient form consists of a cylindrical tube of copper, with a funnel at the top where the rain enters. Connected with the cylinder at the lower part is a glass tube with an attached scale. The water which enters the funnel, stands at the same height in the cylinder and glass tube, and being visible in the latter the height is read immediately on the scale, and the cylinder and tube being constructed so that the sum of the areas of their sections is a given part, for instance a tenth of the area of the funnel at its orifice, each inch of water in the tube is equivalent to the tenth of an inch of water entering the mouth of the funnel. A stop-cock is added for drawing off the water.

Rain Gauge.

RĀININESS, *n.* [from *rainy*.] The state of being rainy.

RĀINING, *ppr.* Pouring or showering down from the upper regions, as water from the clouds.

In Sw. *resa* signifies to go, walk, or travel, and to *raise*; Dan. *rejser*, the same. These verbs appear to be the L. *gradior, gressus*, without the prefix; and *gradior* is the Shemitic רדה, *redah*, which has a variety of significations, but in Syriac, to go, to walk, to pass, as in Latin. Whether the Swedish and Danish verbs are from different roots, blended by usage or accident, or whether the different senses have proceeded from one common signification, to move, to open, to stretch, let the reader judge.] 1. It is evident that the word is from the same root as *red* and *rose*, being named from the colour. *See* RED and ROSE. This word is in some places pronounced corruptly *reezn.*] A dried grape. Raisins are produced from various species of vines; deriving their names partly from the place where they grow, as Smyrnas, Valencias, &c.; and partly from the species of grape of which they are made, as muscatels, blooms, sultanas, &c. Their quality appears, however, to depend more on the method of their cure than on any thing else. The finest raisins are cured either by cutting the stalk of the bunches half through, when the grapes are nearly ripe, and leaving them suspended on the vine till the sun dries and candies them; or by cutting the grapes when fully ripe, and dipping them in a ley made of the ashes of the burnt tendrils, after which they are exposed to the sun to dry. Those cured in the first way are most esteemed. The inferior sorts are very often dried in ovens.

RATAN', *n.* [Malay, *rotan;* Java, *rottang.*] A genus of palms, but widely differing in habit from the rest of that family, and in this respect somewhat resembling the grasses. The species have all perennial, long, round, solid, jointed, unbranching stems, extremely tough and pliable. They grow in profusion along the banks of rivers in tropical Asia and the neighbouring islands. All the species are very useful, and are employed for wicker-work, seats of chairs, walking-sticks, withes and thongs, ropes, cables, &c.

Ratchet-Wheel

against which a ratchet abuts, used either for converting a reciprocating into a rotatory motion on the shaft to which it is fixed, or for admitting of its motion in one direction only. For both of these purposes, an arrangement similar to that shown in the engraving is employed. *a* is the ratchet-wheel; *b* the reciprocating lever, to the end of which is jointed a small ratchet, *c*, furnished with a catch of the same form as the teeth of the wheel, and which, when the lever is moved in one direction, slides over the teeth, but in returning draws the wheel with it. The other ratchet, *d*, which may either be used separately or in combination with the first, permits of the motion of the wheel in the direction of the arrow, but opposes its return in the opposite direction.

6. Degree of value; price. Wheat is often sold at the *rate* of sixty shillings the quarter. Wit may be purchased at too dear a *rate*.—7. A tax or sum

In *the navy*, the order or class of a ship, according to its magnitude or force. The navy is divided into three classes. Rate-ships commanded by captains; sloops and vessels by commanders; and the third class by lieutenants. Rate-ships are divided into six classes. [*See* NAVY.]

RA'TIO, *n.* (ra'sho.) [L. *ratus*, *reor*, to think or suppose, to set, confirm, or establish. *Reor* is contracted from *redor* or *retor*, and primarily signifies to throw, to thrust, hence to speak, to set in the mind, to think, like L. *suppono*; and *setting* gives the sense of a fixed *rate* or rule. *See* REASON.] Proportion, or the relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third. In *geom.*, Euclid defines *ratio* to be "a mutual relation of two magnitudes of the same kind to one another in respect of quantity." In arithmetic and algebra, a *ratio* may be defined as the function whose numerator is the antecedent, and denominator the consequent of the ratio. Thus the ratio of 4 to 2 is $\frac{4}{2}$ or 2; and the ratio of 5 to 6 is $\frac{5}{6}$. Also the ratio of A to B is $\frac{A}{B}$. In comparing two subjects with regard to some quality which they have in common, and which admits of being measured, that measure is their *ratio*. It is the rate in which one exceeds the other. *Proportion* is the *portions* or parts of one magnitude that are contained in another. When the ratio is commensurable (that is, when it is reducible to numbers), it is equivalent to proportion; but the latter term is usually employed in the comparison of ratios, in which case two equal ratios are said to be proportionals. Thus 3 has to 4 a certain ratio or proportion; but the expression 3 is to 4 in the same proportion as 6 to 8, denotes that the ratios of 3 to 4 and 6 to 8 are equal, 3 being the same proportion of 4 as 6 is of 8; that is, of three-fourths.—*Direct ratio.* When two quantities or magnitudes have a certain ratio to each other, and are at the same time subject to increase or diminution; if while one increases the other increases in the same ratio; or if, while one diminishes, the other diminishes in the same ratio; the proportions or comparisons of ratios remain unaltered, and those quantities or magnitudes are said to be in a *direct ratio* or proportion to each other. Thus in uniform motion the space is in the direct ratio of the time.—*Inverse ratio.* When two quantities or magnitudes are such that when one increases the other necessarily diminishes; and *vice versa*, when the one diminishes the other increases, the ratio or proportion is said to be *inverse*. Thus in uniform motion the time is in the inverse ratio of the velocity.—*Compound ratio.* When one quantity is connected with two others in such a manner that if the first be increased or diminished, the product of the other two is increased or diminished in the same proportion, then the first quantity is said to be in the *compound ratio* of the other two. Thus the momentum of a moving body is in the *compound ratio* of the quantity of matter and the velocity.—*Duplicate ratio.* When three quantities are in continued proportion, the first is said to have to the third the *duplicate ratio* of that which it has to the second, or the first is to the third as the square of the first to the square of the second. Also, when any number of quantities are in continued proportion, the ratio of the first to the last is said to be compounded of the several intermediate ratios. *Ratio* respects magnitudes of the same kind only. One line may be compared with another line, but a line cannot be compared with a superficies, and hence between a line and a superficies there can be no *ratio*.—2. *Prime and ultimate ratios*, terms first introduced, at least in a system, by Newton, who preferred them to the terms suggested by his own method of fluxions. The method of prime and ultimate ratios is a method of calculation which may be considered as an

extension of the ancient method of exhaustions. It may be thus explained: Let there be two variable quantities constantly approaching each other in value, so that their ratio or quotient continually approaches to unity, and at last differs from unity by less than any assignable quantity; the *ultimate ratio* of these two quantities is said to be a ratio of equality. In general, when different variable quantities respectively and simultaneously approach other quantities, considered as invariable, so that the differences between the variable and invariable quantities become at the same time less than any assignable quantity, the ultimate ratios of the variables are the ratios of the invariable quantities or *limits* to which they continually and simultaneously approach. They are called *prime ratios* or *ultimate ratios*, according as the ratios of the variables are considered as receding from, or approaching to, the ratios of the limits. The first section of Newton's Principia contains the development of *prime and ultimate ratios*, with various propositions enunciated in their language.

In *arith. and alge.*, a term applied to an expression in finite terms; or one on which no extraction of a root is left; or, at least, none such indicated which cannot be actually performed by known processes. The contraries of these are called *surd* or irrational quantities. Thus 2, 9, 12½, are *rational* quantities, and $\sqrt{2}$, $\sqrt[3]{4}$, &c., are irrational or surd quantities, because their values can only be approximately and not accurately assigned. *Rational* horizon, in *geography*, the plane passing through the centre of the earth parallel to the *sensible horizon* of the place to which it is referred. RA'TIONALISM, *n.* A system of opinions deduced from reason, as distinct from inspiration or opposed to it; the interpretation of Scripture truths upon the principles of human reason, which has become notorious in the present day by the theological systems to which it has given birth in Germany. From the middle of the last century there has arisen in that country a succession of divines—Baumgarten, Michaelis, Semler, Eichhorn, Paulus, Bretschneider, &c., who have endeavoured either to affix a lower and more human character to the invisible operations of God upon men through Christianity, or to reduce the accounts which we have of the foundation of our religion to the mixture of truth and error natural to fallible men. They have questioned the genuineness of almost all the separate parts of Scripture; and the accuracy of all their supernatural narratives. Of late years, however, a much more spiritual conception of the nature of Scripture promises and Christian assistances is observable in the writings of German divines, under the operation of which their theological criticism has already assumed a more wholesome and exalted tone.

RA'TIONALIST, *n.* One who proceeds in his disquisitions and practice wholly upon reason.—2. From the Latin or the original Celtic, the Italians, Spanish, and French have their *re, ra*, as prefixes. In a few English words, all or most of which, as believed, we receive from the French, it has lost its appropriate signification, as in *rejoice, recommend, receive.*

This verb, in Arabic *ariga*, signifies to send forth a grateful smell, to breathe fragrance, the root of the L. *fragro.* But the primary sense is the same, to reach, to extend, to shoot forth. The same word in Ethiopic, *raga*, San. *rich'h*, signifies to congeal or condense, to make stiff or *rigid.* This is the L. *rigeo*, Gr. ῥιγόω, and hence L. *frigeo*, whence *frigid.* This sense also is from stretching or drawing, making tense or rigid. The radical sense of רקע, *raka*, is the same, whence *region*, and the Heb. רקיע, *raki*, the expanse of heaven or the firmament. The L. *rogo* has the same radical sense, to reach, to urge.] 1. It is legally distinguished from *personalty*, principally in two respects: first, its permanent, fixed, and immovable quality; and secondly, that the interest therein must be not less than the term of the life of the owner, or of another person or persons; whereas, personalty is either movable or readily capable of being so; or, as in the case of a lease for years, is considered as of so inferior a nature that it is not allowed the incidents and privileges of *real* property. —*Real action*, in *law*, is an action which concerns real property.—*Real assets*, assets consisting in real estate, or lands and tenements descending to an heir, sufficient to answer the charges upon the estate created by the ancestor.—*Chattels real* are such chattels as concern or savour of the realty; as a term for years of land, the next presentation to a church, &c.—*Real composition* is when an agreement is made between the owner of lands and the parson or vicar, with consent of the ordinary, that such lands shall be discharged from payment of tithes, in consequence of other land or recompense given to the parson in lieu and satisfaction thereof.—*Real presence*, in *the Romish church*, the alleged actual presence of the body and blood of Christ in the eucharist, or the conversion of the substance of the bread and wine into the real body and blood of Christ.—*Real burden*, in *Scots law*, a burden in money imposed on the subject of a right, as on an estate, in the deed by which the right is constituted, and thus distinguished from a *personal burden*, which is imposed merely on the receiver of the right.—*A real action*, in *Scots law*, is founded on a right of property in a subject; the object of the action being the recovery of the property. It is so termed in contradistinction to a personal action, which is founded only on a personal obligation, and the object of which is to enforce implement of the obligation.—*Real right*, in *Scots law*, a right of property in a subject, or as it is termed a *jus in re*, in virtue of which the person vested with the real right may pursue for possession of the subject. Primarily, *reason* is that which is uttered. *See* READ. So Gr. λόγος, from λέγω.] 1. That which is thought or which is alleged in words, as the ground or cause of opinion, conclusion, or determination. I have *reasons* which I may choose not to disclose. You ask me my *reasons*. 4. Final cause.

Reason, in the English language, is sometimes taken for true and clear principles; sometimes for clear and fair deductions; sometimes for the cause, particularly the final cause. *Locke.*

5. A faculty of the mind by which it distinguishes truth from falsehood, and good from evil, and which enables the possessor to deduce inferences from facts or from propositions; and to combine means for the attainment of particular ends. Reason is the highest faculty of the human mind, by which man is distinguished from brutes, and which enables him to contemplate things spiritual as well as material, to weigh all that can be said or thought for and against them, and hence to draw conclusions and to act accordingly. A man may therefore be said to possess reason in proportion as he actually exercises that power, that is, reasons and acts according to the conclusions or results at which he has arrived. In the language of English philosophy, the terms reason and understanding are nearly identical, and are so used by Stewart; but in the critical philosophy of Kant, a broad distinction is drawn between them.

Reciprocal terms, in *logic*, those terms that have the same signification, and consequently are convertible and may be used for each other.—*Reciprocal quantities*, in *math.*, are those which, multiplied together, produce unity.—*Reciprocal figures*, in *geom.*, are two figures of the same kind (triangles, parallelograms, prisms, pyramids, &c.) so related that two sides of the one form the extremes of an analogy of which the *means* are the two corresponding sides of the other.—*Reciprocal ratio* is the ratio between the reciprocals of two quantities; as, the *reciprocal ratio* of 4 to 9, is that of $\frac{1}{4}$ to $\frac{1}{9}$.—*Reciprocal proportion* is when of four terms taken in order, the first has to the second the same ratio which the fourth has to the third; or when the first has to the second the same ratio which the reciprocal of the third has to the reciprocal of the fourth. [*See* RATIO.] In *geom.*, two magnitudes are said to be reciprocally proportional to two others, when one of the first pairs is to one of the second as the remaining one of the second is to the remaining one of the first.

The Saxon word signifies not only to tell or count, but to *reck* or care, and to rule or govern; and the latter signification proves it to be the L. *rego, rectus,* whence *regnum, regno,* Eng. to *reign,* and hence Sax. *reht, riht,* Eng. *right,* G. *recht,* &c. The primary sense of the root is to strain, and *right* is strained, stretched to a straight line; hence we see that these words all coincide with *reach, stretch* and *rack;* and we say, we are *racked* with care. It is probable that *wreck* and *wretched* are from the same root.] 1. To count; to number; that is, to tell the particulars.

Flected* and *reflected* are curvings contrarywise, bending first one way and then another.—*Reflected light*, in *painting*, the subdued light which falls on objects that are in shadow, and serves to make out their forms; it is reflected from some object on which the light falls directly, either seen in the picture or supposed to be acting on it, and is hence called *reflected light.* When there is either no object to reflect the light, or one that reflects feebly, the portions of the picture in shadow are obscure and indistinct; and when there is an object that reflects powerfully, such as a white wall, the shadows of the picture are clear and full of detail.

The term is also applied to a surveying instrument, invented by Sir Howard Douglas, which combines the advantages of Hadley's quadrant and the protractor. REFLEC′TION, *n.* [from *reflect.*] The act of throwing back; as, the *reflection* of light or colours. In *mech.*, the rebound or regressive motion of a body from the surface of another body, against which it impinges. In *nat. phil.*, the term is applied to the analogous motions of light, heat, and sound, when turned from their course by an opposing surface. When a perfectly elastic body strikes a hard and fixed plane obliquely, it rebounds from it, making the angle of reflection equal to the angle of incidence [*see* INCIDENCE], and this law holds true with regard to light, heat, and sound. In the annexed figure, let A B represent a smooth polished surface, or mirror, and suppose a ray of light proceeding in the direction L P to impinge on the surface at P, and to be reflected from it in the direction P R.

From P draw P Q perpendicular to A B, then the angle L P Q is called the *angle of incidence*, and Q P R the *angle of reflection.* Sometimes, however, the angle L P A is taken for the angle of incidence, and R P B for that of reflection. These two angles are in the same plane, and the angle of reflection is equal to the angle of incidence, and on the opposite side of the perpendicular. This law holds true whatever be the nature of the reflecting surface, or the origin of the light which falls upon it. All the phenomena of reflection from mirrors or polished surfaces, whether plane or having any regular curvature, are readily deduced from this law, as simple geometrical consequences.—2. REFLECT′OR, *n.* One who reflects or considers.—2. That which reflects.—3. A polished surface of metal, or any other suitable material, applied for the purpose of transmitting rays of light, heat, or sound, in any required direction. Reflectors may be either plane or curvilinear; of the former the com-

mon mirror is a familiar example. Curvilinear reflectors admit of a great variety of forms, according to the purposes for which they are employed: they may be either convex or concave, spherical, elliptical, parabolic, or hyperbolic, &c. The parabolic form is, perhaps, the most generally serviceable, being that which is employed in lighthouses, and for many other purposes of illumination, as well as for various highly important philosophical instruments. Its property is to transmit, in a parallel stream, and to a great distance, all rays diverging from the focus of the parabola, and conversely. The annexed cut is a section of a ship lantern, fitted with an argand lamp and parabolic reflector. *a a* is the reflec-

Parabolic Reflector

tor, *b* the lamp, situated in the focus of the polished concave paraboloid, *c* the oil cistern, *d* the outer frame of the lantern, and *e* the chimney for the escape of the products of the combustion. The speculum of a reflecting telescope is an example of the converse application of the parabolic reflector, the parallel rays proceeding from a distant body being, in this case, concentrated into the focus of the reflector.

REFLEX', *n.* Reflection.†—2. In *painting*, the illumination of one body, or a part of it by light reflected from another body represented in the same piece. The foundation of the law of *reflexes* depends upon the fact that every body in light reflects that light to a certain degree. The stronger, therefore, the light on the body, the stronger will be the *reflex*, the distances being equal.

REFRACT'ING, *ppr.* Turning from a direct course.—2. *a.* That turns rays from a direct course; as, a *refracting* medium.—*Refracting telescope.* [*See* TELESCOPE.]

REFRAC'TION, *n.* The deviation of a moving body, chiefly rays of light, from a direct course. A ray of light, when it enters a medium of a different

density, deviates from its original path and is bent at the surface of the medium. This deviation or bending is called *refraction*, and is the ultimate fact from which many of the most interesting phenomena of light receive their explanation. Suppose a beam of light proceeding from a luminous point S to be admitted through a small hole A, in the side of a vessel A B; then, the vessel being empty, the light will fall on the bottom at a point L, in the same straight line with S and A. Now let water be poured into the vessel, and suppose the beam of light to fall on its surface at P; then it will be seen that the light no longer continues its course in the same straight line, but is bent or *refracted* at P, and proceeds through the water in a straight line P R more nearly perpendicular to the surface.

A similar deviation takes place in all cases in which light passes from one transparent medium into another; but the magnitude of the angle R P L, or the amount of the refraction, varies according to the nature of the two media, and the degree of obliquity with which the incident ray falls on the surface of separation. If through P, Q P *q* be drawn perpendicular to the surface; then S P Q is the *angle of incidence*, and R P *q* the *angle of refraction*, and both these angles are in the same plane, and they are always on opposite sides of the perpendicular. The sine of the angle of incidence has to the sine of the angle of refraction a constant ratio, whatever be the inclination of the incident ray to the surface. When a ray of light passes from a rarer into a denser medium the refraction is towards the perpendicular, or the angle of refraction is less than the angle of incidence. On the contrary, when a ray of light passes from a denser into a rarer medium, the refraction is from the perpendicular, or the angle of refraction is greater than the angle of incidence.—*The index of refraction* of any transparent substance, is the ratio of the sine of incidence to the sine of refraction, when light passes from a vacuum into the substance.—*Astronomical refraction*, the apparent angular elevation of the heavenly bodies above their true places, caused by the refraction of the rays of light in their passage through the earth's atmosphere, so that in consequence of this refraction the heavenly bodies appear higher than they really are. It is greatest when the body is in the horizon, and diminishes all the way to the zenith, where it is nothing.—*Terrestrial refraction*, that refraction which makes terrestrial elevated objects appear to be raised higher than they are in reality. This arises from the air being denser near the surface of the earth than it is at higher elevations, its refractive power increasing as the density increases.—*Double refraction*, the separation of a ray of light into two separate parts, by passing through certain transparent mediums, as the Iceland crystal. All crystals, except those whose primitive form is either a cube or a regular octahedron, exhibit double refraction.

REFRACT'IVE, *a.* That refracts or has power to refract or turn from a direct course; as, *refractive* densities. —*Refractive power*, in *optics*, the degree of influence which a transparent body exercises on the light which passes through it.—*Absolute refractive power*, or *absolute refraction*, the ratio of the refractive power of a substance to its density.

Newton showed that the sun's light consists of rays which differ in refrangibility, as well as in colour, and on this he founded his whole theory of colours.

Numerous contrivances have been devised for this purpose, but the one most generally used is the *day and night thermometer* of Dr. Rutherford. It consists of two thermometers, the one a mercurial, and the other a spirit thermometer, attached horizontally to the same frame, and each provided with its own scale. The mercurial thermometer contains, as an index, a bit of steel wire which is pushed before the mercury, and is left where the mercury begins to recede, marking how high the temperature had been. The spirit thermometer contains an index of glass half an inch long, with a small knob at each end. This lies in the spirit, which freely passes it when the thermometer rises, but when the spirit recedes the cohesive attraction between the spirit and the glass overcomes the friction arising from the weight of the index, so that it is carried back with the spirit towards the bulb. As there is no force to move it in the opposite direction, it remains at the point nearest the bulb to which it has been brought, and thus indicates the lowest temperature which has occurred during the interval between the observations.

This word seems originally to have signified an oath or vow to the gods, or the obligation of such an oath or vow, which was held very sacred by the Romans.] 1. Religion, in its most comprehensive sense, includes a belief in the being and perfections of God, in the revelation of his will to man, in man's obligation to obey his commands, in a state of reward and punishment, and in man's accountableness to God; and also true godliness or piety of life, with the practice of all moral duties. It therefore comprehends theology, as a system of doctrines or principles, as well as practical piety; for the practice of moral duties without a belief in a divine lawgiver, and without reference to his will or commands, is not religion. —2. *Religion*, as distinct from *theology*, is godliness or real piety in practice, consisting in the performance of all known duties to God and our fellow men, in obedience to divine command, or from love to God and his law; James i.

Religion will attend you ...as a pleasant and useful companion, in every proper place and every temperate occupation of life. *Buckminster.*

3. *Religion*, as distinct from *virtue*, or *morality*, consists in the performance of the duties we owe directly to God, from a principle of obedience to his will. Hence we often speak of *religion* and *virtue*, as different branches of one system, or the duties of the first and second tables of the law.

Let us with caution indulge the supposition, that morality can be maintained without *religion*. *Washington.*

4. Any system of faith and worship. In this sense, religion comprehends the belief and worship of pagans and Mohammedans, as well as of Christians; any religion consisting in the belief of a superior power or powers governing the world, and in the worship of such power or powers. Thus we speak of the *religion* of the Turks, of the Hindoos, of the Indians, &c., as well as of the Christian *religion*. We speak of *false religion*, as well as of *true religion*. —5. The rites of religion; in the plural. —*Established religion*, that form of religion in a state which is recognized and sanctioned by the state, in distinction from other forms, and to which certain privileges and distinctions are attached. The episcopal form of religion is established in England, and the presbyterian form in Scotland.

RENT, *n.* [Fr. *rente*, from *rendre;* D. Dan. and G. *rente.*] A sum of money, or a certain amount of other valuable thing, issuing yearly from lands or tenements. Rent in law is defined "a certain profit issuing yearly out of lands and tenements corporeal," not necessarily, although by English usage generally, consisting in money. Rents, at common law, are of three kinds; *rent-service, rent-charge*, and *rent-seck. Rent-service* is when some corporal service is incident to it, as by fealty and a sum of money; *rent-charge* is when the owner of the rent has no future interest or reversion expectant in the land, but the rent is reserved in the deed by a clause of distress for rent in arrear; *rent-seck*, dry rent, is rent reserved by deed, but without any clause of distress. There are also *rents of assize*, certain established rents of free-holders and copy-holders of manors, which cannot be varied; called also *quit-rents*. These, when payable in silver, are called *white rents*, in contradistinction to rents reserved in work or the baser metals, called *black rents* or *black mail*. *Rack-rent* is a rent of the full value of the tenement, or near it. A *fee farm rent* is a rent-charge issuing out of an estate in fee, of at least one fourth of the value of

the lands at the time of its reservation. The time of paying rents is either by the particular appointment of the parties in the deed, or by appointment of law, but the law does not control the express appointment of the parties, when such appointment will answer their intention. In England, Michaelmas and Lady-day are the usual days appointed for payment of rents; and in Scotland, Martinmas and Whitsunday.

REP'TILE, *n.* 1. In a general sense, an animal that moves on its belly, or by means of small short legs, as snakes, lizards, tortoises, and the like. But the term *Reptiles* or *Reptilia*, when used zoologically, is confined to the designation of those cold-blooded quadruped, biped, apode, oviparous, and ovoviviparous vertebrated animals that breathe by means of lungs principally, and are without hair, feathers, or mammæ. Such animals form the subject of that branch of zoological science termed *Herpetology*. Reptiles form the third class of vertebrated animals according to the arrangement of Cuvier, and it is divided into four orders, namely, chelonia or tortoises, sauria or lizards, ophidia or serpents, and batrachia or frogs. Of these four orders the chelonians and batrachians are partly aquatic, partly terrestrial; the saurians and ophidians are principally tenants of the land. A commonwealth; a political community in which several persons share the sovereign power, or that form of government in which the supreme power is vested in the people, or in representatives chosen by them. A republic may be either an aristocracy or a democracy; the supreme power in the former being consigned to the nobles, or a few privileged individuals, as was formerly the case in Venice and Genoa; while in the latter the supreme power is placed in the hands of rulers chosen by and from the whole body of the people, or by their representatives assembled in a congress or national assembly. Hamburg, Frankfort, Lübeck, and Bremen are instances of this latter form of government; but the most perfect example of it is to be found in the United States, and in some of the South American confederations which have shaken off the Spanish yoke. Governments usually styled limited monarchies, are properly aristocracies presided over by a king; and consequently ought to be referred to the class of republics, and not to that of monarchies.—2.† Common interest; the public.—*Republic of letters*, the collective body of learned men.

REPUL'SION, *n.* In *physical science*, that power or principle by which bodies or the particles of bodies under certain circumstances are made to recede from each other. Both attraction and repulsion exist in all the particles of material substances, and seem to be properties by which those particles act upon one another when not in contact. The cause of these actions is utterly unknown to us, and the terms are only applied in conformity to the phenomena exhibited. At all sensible distances bodies small and great, except in certain states, with respect to electricity or magnetism, attract one another. But the phenomena of light and elasticity in general show that at distances which are not appreciable by the eye, both attractions and repulsions take place. The elasticity of bodies is a result either of attractive or repulsive powers, or both. For example, when a steel rod is bent, and allowed to recover itself, a force of attraction will be exerted on one side, and of repulsion on the other. The expansions of solids and fluids by heat, and the elastic powers of gas at different temperatures, are consequences of the repulsions residing in the particles of caloric, or induced by the latter in those of the bodies with which they are combined. The forces both of attraction and repulsion, by which the particles of light are deflected from their course, when they impinge on a refracting or reflecting surface, are enormous, and Sir John Herschel computes that they exceed the force of gravity in the ratio of 2×10^{14} to 1. There is a repulsion between oil and water, iron and mercury, between similar poles of magnets, and between bodies in the same electrical state. In air and liquids it has been concluded that the particles do not touch, but are kept asunder at determinate distances

from each other by the constant action of the two forces of attraction and *repulsion*, which are supposed to balance and counteract each other.—2. The act of repelling.

The peculiar uses of this word are to be noticed. When the word is applied to the natives of a state, or others who dwell in it as permanent citizens, we use it only with reference to the *part* of a city or country in which a man dwells. We do not say generally, that Englishmen *reside* in England, but a particular citizen *resides* in London or York, or at such a house in such a street, in the Strand, &c. When the word is applied to strangers or travellers, we do not say a man *resides* in an inn for a night, but he *resided* in London or Oxford, a month or a year; or, he may *reside* in a foreign country a great part of his life. A man lodges, stays, remains, abides, for a day or very short time, but *reside* implies a longer time, though not definite. 2.† To sink to the bottom of liquors; to settle. RESID'UAL, *a.* Remaining after a part is taken.—*Residual analysis*, a branch of analysis invented by Landen, and applied by him to the solution of those problems which are more generally solved by the doctrine of fluxions. This method was called the residual analysis, because, in all cases where it is made use of, the conclusions are obtained by means of residual quantities. In this analysis a geometrical or physical problem is reduced to another purely algebraical, and the solution is then obtained without any supposition of motion, and without considering quantities as composed of infinitely small particles. *Residual quantity*, in *algc.*, a binomial connected by the sign—(minus;) thus $a-b$, $a-\sqrt{6}$ &c., are residual quantities.—*Residual figure*, in *geom.*, the figure remaining after subtracting a less from a greater.—*Residual phenomenon*, a term lately brought into partial use to signify that part of a phenomenon which is left when every part which can be explained or accounted for is removed. This residual phenomenon may be all the observer's error, or may be partly the effect of some undiscovered law, and partly the error of the observer.

RES'IN, *n.* (*s* as *z.*) [Fr. *resine*; L. It. and Sp. *resina*; Ir. *roisin*; Gr. ῥητίνη, probably from ῥέω, to flow.] Resins are solid inflammable substances, which are insoluble in water, but soluble in alcohol and essential oils. When cold they are more or less brittle and translucent, and of a colour inclining to yellow. When pure they are nearly insipid and inodorous. They are non-conductors of electricity, and when excited by friction, their electricity is negative. They are heavier than water, and they melt by heat. They combine with the alkalies of the metals, performing the function of weak acids, and forming soaps. They are soluble in many of the acids, and convertible by some into other peculiar acids. They frequently exude from trees in combination with essential oils, and in a liquid or semi-liquid state. They are composed of carbon, hydrogen and oxygen, and are supposed to be formed by the oxygenation of the essential oils. There is a great number and variety of the resins They are valuable as ingredients in varnishes, and several of them are used in medicine. They are often naturally blended with gum, in which they constitute the series of *gum-resins*. [*See* GUM.] The soft resins which retain a certain portion of volatile oil constitute what are called balsams. *Kauri* or *Cowdee* resin, a new and very peculiar substance, recently imported from New Zealand, and obtained from a tree called *Dammara australis*, or Pinus Kauri. Its colour varies from milk-white to amber, or even deep brown. RES'INOUSNESS, *n.* The quality of being resinous.

RES INTER ALIOS ACTA, ALIIS NEC NOCET, NEC PRODEST, [L.] A maxim in *Scots law*, signifying that things done between particular individuals neither injure nor benefit others. It is said of a judgment in a cause which affects only the parties in the cause, and not others, though concerned.

Resistance is *passive* as that of a fixed body which interrupts the passage of a moving body; or *active*, as in the exertion of force to stop, repel, or defeat, progress or designs. 2. The quality of not yielding to force or external impression; that power of a body which acts in opposition to the impulse or pressure of another, or which prevents the effect of another power; as, the *resistance* of a ball which receives the force of another; the *resistance* of wood to a cutting instrument; the *resistance* of air to the motion of a cannon-ball, or of water to the motion of a ship. The *resistance* produced by the rubbing of the surfaces of two bodies against each other, caused by the asperities or inequalities of the rubbing surfaces, is called *friction*,—*which see*.—*Resistance* or *resisting force*, in *mech.*, denotes, generally, a force acting in opposition to another force so as to destroy it, or diminish its effect. It is a power by which motion, or a tendency to motion in any body, is retarded or prevented. Resistance is sometimes considered as of two kinds, *active* and *passive*, the first being that which corresponds to the useful effect produced by a machine, and the second that which arises from the inertia of the machine. *Solid of least resistance*, in *mech.*, the solid whose figure is such that in its motion through a fluid, it sustains the least resistance of all others having the same length and base; or, on the other hand, being stationary in a current of fluid, offers the least interruption to the progress of that fluid. In the former case it has been considered the best form for the stem of a ship; in the latter the proper form for the pier of a bridge. The problem of finding the solid of least resistance was first proposed and solved by Newton.

A problem may be divided into three parts—the proposition, the resolution, and the demonstration.—*Resolution of forces or of motion*, in *dynamics*, the dividing of any single force or motion into two or more others, which, acting in different directions, shall produce the same effect as the given motion or force. This is the reverse of *composition of*

forces or of motion. Thus let A B represent the quantity and direction of some given force; draw any lines A C, A D; and join C B, D B, and complete the parallelograms A D B E, A C B F. Then by composition of forces the force A B is equivalent to A D and A E, or to A C and A F. Hence it is evident that a given force, as A B, may be resolved into as many pairs of forces as there can be triangles described upon a given straight line A B, or parallelograms about it. And as the forces represented by A D, D B, or A C, C B, may also be resolved into other pairs of forces, it appears that by proceeding in the same manner with the successive pairs of forces, a given force may be resolved into an unlimited number of others, acting in all possible directions. [*See* COMPOSITION, FORCE, RESULTANT.]

This gas is accordingly found in the air which is expired from the lungs; and the blood having lost its carbonic acid, at the same time loses its dingy hue, and acquires, through the inhalation of oxygen from the air, the florid red which characterizes arterial blood. Respiration alternates with *inspiration*, which takes place about twenty-six times in a minute, thirteen cubic inches of air being the average quantity taken in at each inspiration. To inflict pain or injury in return for an injury received. —*Note.* This word and *avenge* were formerly used as synonymous, and it is so used in the common version of the Scripture, and applied to the Supreme Being. "O Lord—*revenge* me of my persecutors;" Jer. xv. In consequence of a distinction between *avenge* and *revenge*, which modern usage has introduced, the application of this word to the Supreme Being appears extremely harsh, irreverent, and offensive. *Revenge* is now used in an ill sense, for the infliction of pain maliciously or illegally; *avenge* for inflicting just punishment.—2. According to *modern usage*, to inflict pain deliberately and maliciously, contrary to the laws of justice and humanity, in return for injury, pain, or evil received; to wreak vengeance spitefully on one who injures or offends. In the latter case *revenue* is—2. RHUMB, *n.* [from *rhomb.*] In *navigation*, a vertical circle of any given place, or the intersection of such a circle with the horizon; in which last sense rhumb is the same as a point of the compass.—2. A circle on the earth's surface making a given angle with the meridian of the place.

RHUMB'-LINE, *n.* In *navigation*, a line prolonged from any point of the compass on a nautical chart, except from the four cardinal points; or it is the line described by a ship while her course is constantly directed towards one and the same point of the compass, except the four cardinal points. RHUS, *n.* Sumach, a genus of deciduous trees and evergreen shrubs; nat. order Anacardiaceæ. This genus is found in the south of Europe, in Africa, in Asia, and North and South America. Most of the species are poisonous, but they are much cultivated as ornamental shrubs, on account of the beautiful red colour of their leaves in autumn. Many of them are used also for the purposes of dyeing and tanning; as an astringent principle, to which is frequently added an acid, is common to the whole genus. The juice of *R. toxicodendron*, the poison-tree or poison-oak, is extremely poisonous. So also is the juice of *R. radicans*, or rooting poison-oak. *R. coriaria*, or elm-leaved Sumach, is extensively used for the purpose of tanning; *R. copallina*, gum-copal or mastic-leaved Rhus, is supposed to yield the gum-copal of commerce, from which copal-varnish is made. *R. vernicifera*, the varnish-bearing Sumach or Japan varnish-tree, yields a varnish used by the Japanese, and applied to furniture, and almost every thing made of wood. *R. venenata*, the poison Sumach or swamp Sumach, a native of North America, is exceedingly poisonous; so virulent that it is said to affect some persons by merely smelling it.

RHYME, *n.* [Sax. *rim*, and *ge-rim*, number; *riman*, to number; *ge-riman*, id.; *riman* and *ryman*, to give place, to open a way, to make *room ;* G. *reim ;* W. *rhiv;* Ir. *rimh* or *reomh*. The Welsh word is rendered also, that divides or separates, and the Sax. *rim* seems to be connected with *room*, from opening, spreading. The deduction of this word from the Greek ῥυθμος, is a palpable error. The true orthography is *rime* or *ryme ;* but as *rime* is hoar-frost, and *rhyme* gives the true pronunciation, it may be convenient to continue the present orthography.] 1. In *poetry*, the correspondence or consonance of sounds in the terminating words or syllables of two verses, one of which succeeds the other immediately, or at no great distance.

> For *rhyme* with reason may dispense,
> And sound has right to govern sense. *Prior.*

To constitute this correspondence in single words or in syllables, it is necessary that the *vowel*, and the *final* articulations or consonants, should be the same, or have nearly the same sound. The initial consonants may be different, as in *find* and *mind*, *new* and *drew*, *cause* and *laws*.—2. An harmonical succession of sounds.

> Some dance, some haul the rope. *Denham.*

In *music*, variety in the movement as to quickness or slowness, or length and shortness of the notes; or rather the proportion which the parts of the motion have to each other. —2. Metre; verse; number.—3. Rhythm is the consonance of measure and time in poetry, prose composition, and music, and by analogy, dancing. In *poetry*, it is the relative duration of the moments employed in pronouncing the syllables of a verse; and in *music*, the relative duration of the sounds that enter into the composition of an air. *Prose* also has its *rhythm*, and the only difference (so far as sound is concerned) between verse and prose is, that the former consists of a regular succession of similar cadences, or of a limited variety of cadences, divided by grammatical pauses and emphases into proportional clauses, so as to present sensible responses to the ear, at regular proportioned distances; prose, on the other hand, is composed of all sorts of cadences, arranged without attention to obvious rule, and divided into clauses which have no obviously ascertained proportion, and present no responses to the ear at any legitimate or determined intervals. In *dancing*, the rhythm is recognised in the sound of the feet.

The primary sense is probably to strain or extend.] 1. Stiff; not pliant; not easily bent. It is applied to bodies or substances that are naturally soft or flexible, but not fluid. We never say, a *rigid* stone, or *rigid* iron, nor do we say, *rigid* ice; but we say, an animal body or limb, when cold, is *rigid. In all theoretical investigations respecting the application of forces through the intervention of machines, those machines are assumed (except cords) to be perfectly rigid, so far as the forces employed are able to affect their integrity of form and structure. *Rigidity* in the arts is often called *stiffness,* and is opposed to flexibility. The *rigidity of cords,* or the difficulty with which they are bent into any given curve, is the chief cause of the loss of power arising from their employment in machines. The force necessary to bend a rope is directly as its diameter, directly as the tension, and inversely as the diameter of the pulley or axle round which it is wound.—2. A brittle hardness, as opposed to *ductility, malleability* and *softness.*—3. Stiffness of appearance or manner; want of ease or airy elegance.—4. Strictness; severity. The primary sense then is to throw or dash, or to rush, to drive forward. *See* PERIL, RASH, and RUSH.] —1. Hazard; danger; peril; exposure to harm. He, at the *risk* of his life, saved a drowning man.—2. In *com.*, the hazard of loss, either of ship, goods, or other property. Hence, *risk* signifies also the degree of hazard or danger; for the premiums of insurance are calculated upon the *risk.* The underwriters now take *risks* at a low premium. In the theory of probabilities, the *risk* of loss or gain signifies such a fraction of the sum to be lost or gained,

as expresses the chance of losing or gaining it; thus, an even chance of losing £40 is considered as a positive loss of one-half of £40, or of £20; and 2 to 1 of gaining £60 is counted as two-thirds of £60 or £40. If both these risks were encountered at the same time, the whole transaction would be considered as a gain of £40—£20, or £20, since this is the sum which would be netted by every such transaction in the long run, and one with another.—*To run a risk*, is to incur hazard; to encounter danger.

RISK, *v. t.* To hazard; to endanger; to expose to injury or loss; as, to *risk* goods on board of a ship; to *risk* one's person in battle; to *risk* one's fame by a publication; to *risk* life in defence of rights.—2. To venture; to dare to undertake; as, to *risk* a battle or combat.

RIV'ER, *n.* [Fr. *rivière;* It. *riviera;* from L. *rivus, rivulus;* D. *rivier.* The Italian word signifies a river, and a bank or shore, L. *ripa.*] 1. An inland current of water formed within a certain portion of the earth's surface by the confluence of brooks, small streams, or mountain torrents, and discharging itself into the ocean, a lake, marsh, or other river. The country which is drained by a river is called its basin, as the river runs in the lowest part of it. A *brook* is the name given to rivers of the smallest description, and if the waters should be increased by those of another brook, the name of brook is changed into that of *rivulet.* When several rivulets unite and so produce a considerable volume of running water, this water-course takes the name of *river.* But all such rivers do not reach the sea or even a lake; most of them join other rivers, and thus a large river is produced. This last mentioned river is called the *principal river*, and those which increase its waters are called, with respect to it, *affluents* or *tributaries*, and sometimes *feeders* or *branches.* The first waters of a river are generally derived from a spring which breaks out at the foot of a declivity or on the side of some hill or mountain, and sometimes from a swamp or lake. This is called the *source* of a river. From this source the river descends through the lowest part of its basin until it terminates its course in the sea, a lake, or another river, and this termination is called the *mouth* of the river. The cavity in which the running water flows is called the *bed* of the river, and the solid land which bounds this bed is called its *banks.* Most large rivers have their origin in very elevated mountains, or on high table-lands, in descending from which, a great difference with respect to the rapidity of their course, and the nature of the country through which they flow, is observed accordingly by geographers, who divide the whole of the course of such rivers into three divisions, the *upper, middle,* and *lower* course. Most rivers overflow the low countries which are adjacent to their banks, either at regular seasons of the year or occasionally. This takes place when the supply of water is greater than the bed of the river can contain. The periodical inundations depend on great falls of rain in mountainous regions, or on the melting of snow and ice in the neighbourhood of their source. The period depends on the return of these seasons in different places. The largest rivers in the world are the Amazon and La Plata, in South America; the Mississippi, Missouri, and St. Lawrence, in North America; the Yang-tze-kiang, the Hoanho, the Lena, the Ganges, the Indus, and the Euphrates, in Asia; the Nile and the Niger, in Africa; and the Volga, the Danube, and the Rhine, in Europe. In a *legal sense*, rivers are divisible into *fresh* and *salt-water rivers.* Salt-water rivers are those rivers, or parts of rivers, in which the tide ebbs and flows. Rivers are also divisible into *public* or *navigable* rivers, and *private rivers.*—2. A large stream; copious flow; abundance; as, *rivers* of blood; *rivers* of oil.—3. In *hydraulics*, a current of water flowing in an open channel. The velocity of a current of water flowing in an open channel depends on the volume of water, the form of the channel, and its inclination; and the determination of the relations subsisting among these three quantities is a problem of great practical importance, the solution of which must be derived partly from experiment, and partly from the general theory of the motion and resistance of fluids.

A bird of the genus Corvus, the bird mentioned by Virgil under this name, the *C. frugilegus,* Linn. This bird resembles the crow, but differs from it in not feeding on carrion, but on insects and grain. In crows also the nostrils and root of the bill are clothed with feathers, but in rooks the same parts are naked, or have only a few bristly hairs. The rook is content with feeding on the insect tribe (particularly the larvæ of the cock-chaffer), and on grain; and there can be no doubt that it amply repays the farmer for the seed it takes, by its assiduity in clearing the land of wire-worms and the destructive grub. Rooks are gregarious at all seasons, resorting constantly to the same trees every spring to breed, when the nests may be seen upon the upper branches. They are spread over the greater part of Europe; but no where do they seem to be more abundant than in Great Britain and Ireland.—2. A cheat; a trickish, rapacious fellow.

That part of a plant which enters and fixes itself in the earth, and serves to support the plant in an erect position, while by means of its radicles, it imbibes nutriment for the stem, branches and fruit. There are six distinct organs which are capable of entering into the composition of a root, viz. the *radicle,* the *fibril,* the *soboles,* the *bulb,* the *tuber,* and the *rhizoma.* Roots receive different names according to their structure, forms, and positions; as branched, bulbiferous, fibrous, horizontal, oblique, simple, tapering, vertical, &c.—2. The part of any thing that resembles the roots of a plant in manner of growth; as, the *roots* of a cancer, of teeth, &c.—3. The bottom or lower part of any thing.

The love of money is the *root* of all evil; 1 Tim. vi.

7. In *arith.* and *alge.,* the root of any quantity is such a quantity as, when multiplied into itself a certain number of times, will exactly produce that quantity. Thus 2 is a root of 4, because when multiplied into itself, it exactly produces 4. The power is named from the number of the factors employed in the multiplication, and the root is named from the power. Thus if a quantity be multiplied once by itself, the product is called the second power or square, and the quantity itself the *square root,* or second root of the product; if the quantity be multiplied twice by itself we obtain the third power, or cube, and the quantity is the *cube root* or third root, and so on. The algebraic sign of a root is $\sqrt{}$, and the particular root is indicated by placing above the sign the figure which expresses the number of the root, which figure is called the index of the root. Thus $\sqrt[4]{16}=2$, indicates the fourth root of 16; $\sqrt{4}$ or $\sqrt[2]{4}=2$, the square root of 4. The same is the case with algebraic quantities, as $\sqrt[3]{a^3+3a^2b+3ab^2+b^3}=a+b$. [*See* POWER, INDEX, INVOLUTION, EVOLUTION.] *Root of an equation,* in *alge.,* the value of the unknown quantity which enters into the equation. [*See* EQUATION.]—8. Means of growth. Indeed the smaller *ropes*, when used for certain purposes, are called *lines.*—*Ropes* are, by seamen, ranked under two descriptions, *cable-laid* and *hawser-laid;* the former composed of nine strands, or three great strands, each consisting of three small ones; the latter made with three strands, each composed of a certain number of rope-yarns.—2. When the rope is to be tarred, that operation is usually performed upon the yarns immediately after their being warped. A suitable number of yarns are next formed into a strand, and three or more such strands are afterwards combined into a rope. The twist of the strand is in an opposite direction to that of the yarns of which it is composed, in order that the tendency to entwist in one part may counteract the like tendency in another.

ROT, *n.* A fatal distemper incident to sheep, usually supposed to be owing to wet seasons and moist pastures. According to some, the immediate cause of the mortality of sheep, in this disease, is a great number of small animals, called flukes, (*Fasciola*,) found in the liver, and supposed to be produced from eggs swallowed with their food. Others assign as the cause the eating of some particular plants; others the eating of snails and other ingesta; but those most competent to form a correct opinion on the subject, consider that the immediate causes of the disease are a humid state of atmosphere, soil, and product. The disease has different degrees of rapidity, but is always fatal at last; and the treatment of it is seldom successful, unless when early commenced, or when it is of a mild nature.—2. ROT'ATING, *ppr.* and *a.* Revolving; moving round a centre.
ROTA'TION, *n.* [L. *rotatio*, from *roto*, to turn; *rota*, a wheel.] 1. The act of turning; the motion of a solid body, as a wheel or sphere, about an axis, as distinguished from the progressive motion of a body revolving round another body or a distant point. Thus the daily turning of the earth on its axis is a *rotation*; its annual motion round the sun is a *revolution* The determination of the circumstances of the rotation of a planet about its axis, is an important problem in physical astronomy; and also in relation to practical mechanics, the problem of rotation is of great importance, inasmuch as it comprehends the methods of computing the performance of machines, the forces necessary to overcome their inertia, and the proper relations and most advantageous dispositions of their several parts, in order that the required effect may be produced by the smallest expenditure of power, and the least strain or injury to the machine itself.—*Axis of rotation*, the axis or line about which a revolving body turns. —*Principal axes of rotation:* if a point, which is not the centre of gravity, be taken in a solid body, all the axes which pass through that point (and they may be infinite in number) will have different moments of inertia, and there must exist one in which the moment is a maximum, and another in which it is a minimum. Those axes, in respect of which the moment of inertia is a maximum or minimum, are called the *principal axes of rotation.* In every body, however irregular, there are three principal axes of rotation, at right angles to each other, on any one of which, when the body revolves, the opposite centrifugal forces counterbalance each other, and hence the rotation becomes permanent. —*Centre of rotation*, the point about which a body revolves. It is the same as the centre of motion.—*Centre of spontaneous rotation*, the point about which a body, all whose parts are at liberty to move, and which has been struck in a direction not passing through its centre of gravity, begins to turn. If any force is impressed upon a body or system of bodies, in free space, and not in a direction passing through the centre of gravity of the body or system, a rotatory motion will ensue about an axis passing through the centre of gravity, and the centre about which this motion is performed is called the *centre of spontaneous rotation.*—*Angular velocity of rotation*; when a solid body revolves about an axis, its different particles move with a velocity proportional to their respective distances from the axis; and the velocity of the particle whose distance from the axis is unity, is the *angular*

velocity of rotation.—*Rotation in bot.*, is the movement of fluids in the cells of some plants, as *chara* and *vallismeria*. The movements take place in a spiral manner, and are seen under the microscope by means of the small granular bodies which are carried along by the currents.—*Rotation of crops*, in *agriculture* and *gardening*, the mode in which different kinds of crops are made to succeed each other in the same field or plat. It is found that the same annual crop cannot be advantageously cultivated on the same soils for more than one or two years, and hence one kind of crop is made to succeed another. But as the number of cultivated crops is limited, when the whole course has been gone through once, it is again repeated; and hence the origin of the word *rotation* as applicable to crops. The same number and kind of crops, however, are not always grown in regular succession, but a change is frequently made according to general principles, and the term used in that case is *succession of crops*. Different soils and climates require different systems of rotation; but it is a recognized rule in all cases, that culmiferous crops ripening their seeds, should not be repeated without the intervention of pulse, roots, herbage, or fallow. —2. Vicissitude of succession; the course by which officers or others leave their places at certain times, and are succeeded by others.

RO'TATORIES, or **ROTATO'RIA**, *n.* [L. *rota*, a wheel.] A section of infusorial animals. [*See* ROTIFERS.]

RO'TATORY, *a.* [from *rotator.*] Turning on an axis, as a wheel; rotary.—2. Going in a circle; following in succession; as, *rotatory* assemblies.—[This word is often used, probably by mistake, for *rotary*. It may be regularly formed from *rotator*, but not with the exact sense in which it is used. With *rotator* for its original, it would signify *causing*, rather than *being* in a circular motion. The true word is *rotary*.]—*Rotatory, or Rotary steam-engine*, an arrangement of mechanism, by which the elastic force of steam is employed to obtain motion round an axis, without the intervention of reciprocating parts. In the majority of cases in which the steam-engine is used as a source of power, it is for the production of motion in the state referred to, and it has been naturally inferred by many, that by simply causing the steam to act directly upon surfaces rigidly connected with the shaft to be set in motion, the most powerful effect would be produced, and in the most economical manner. Numerous plans have been proposed for carrying this into effect, but, however unobjectionable in theory, the practical difficulties to be contended with have hitherto been found to be so great, that no efficient rotatory engine has as yet been invented, which can at all come into competition with the ordinary reciprocating engine.

ROTE, *n.* [a contraction of *crowd*, W. *crwth*, Ir. *cruit.*] An old musical instrument, played with a wheel; a sort of hurdy-gurdy.

ROTE, *n.* [L. *rota*, a wheel, whence Fr. *routine.*] Properly, a round of words; frequent repetition of words or sounds, without attending to the signification, or to principles and rules; a practice that impresses words in the memory, without an effort of the understanding, and without the aid of rules. Thus children learn to speak by *rote;* they often repeat what they hear, till it becomes familiar to them. So we learn to sing by *rote*, as we hear notes repeated, and soon learn to repeat them ourselves.

ROTE, *v. t.* To fix in the memory by means of frequent repetition ourselves, or by hearing the repetition of others, without an effort of the understanding to comprehend what is repeated, and without the aid of rules or principles. [*Little used.*]

It has been cultivated from time immemorial, and is considered as coming nearer in its properties to wheat than any other grain. It is more common than wheat in many parts of the continent, being a more certain crop, and requiring less culture and manure. It is the bread corn of Germany and Russia. It was formerly raised in considerable quantities as a bread corn in England, but now it is mostly sown as a green crop for food to sheep and cattle in spring. In the Netherlands, it is the chief grain from which the spirit called Hollands is distilled, and when malted it makes excellent beer. Two parts of wheat and one of rye ground together make an excellent bread. Rye straw is useless as fodder, but forms an excellent material for thatching. It is also used for stuffing horse-collars, for mattresses, and for making straw-hats and bonnets. S

S, THE nineteenth letter of the English Alphabet, is a sibilant articulation, and numbered among the semi-vowels. It represents the hissing made by driving the breath between the end of the tongue and the roof of the mouth, just above the upper teeth. It has two uses; one to express a mere hissing, as in *sabbath, sack, sin, this, thus*; the other a vocal hissing, precisely like that of *z*, as in *muse, wise*, pronounced *muze, wize*. It generally has its hissing sound at the beginning of all proper English words, but in the middle and end of words, its sound is to be known only by usage. In a few words it is silent, as in *isle* and *viscount*. In abbreviations, S. stands for *societas*, society, or *socius*, fellow; as, F. R. S. fellow of the Royal Society. SĀFETY-VALVE, *n.* A contrivance for obviating or diminishing the risk of explosions in steam-boilers. The form and construction of safety-valves are exceedingly various, but the principle of all is the same: that of opposing the pressure within the boiler, by such a force as will yield before it reaches the point of danger and permit the steam to escape. The most simple and obvious kind of safety-valve is that in which a weight is placed directly over a steam-tight plate, fitted to an aperture in the boiler. When, however, the pressure is high, this form becomes inconvenient, and the lever safety valve is adopted. This form is represented in fig. 1,

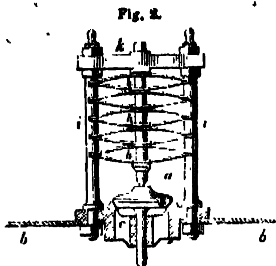

Fig. 1.

where *a* is the valve, fitted to move vertically, and guided by a stem passing through the seat; *b*, the boiler; *c*, the valve-seat, usually, as well as the valve itself, formed of gun-metal; *d*, the lever working upon a fixed centre at *e*, and pressing upon the valve by a steel point; *f* is a guide for the lever, and *g* a weight which may be adjusted to

any distance from the centre, according to the pressure required. In locomotive engines, where a weight cannot with propriety be employed, it is usual to adopt the spring safety-valve, one form of which is shown at fig. 2. A series

of bent springs, *h h h*, are placed alternately in opposite directions, their extremities sliding upon the rods, *i i*, and are forced down upon the valve, *a*, by means of a cross bar, *h*, which may be adjusted by means of the nut, so as to give the right pressure upon the valve.

SAF'FLOWER, *n*. Bastard saffron, a plant of the genus Carthamus, the *C. tinctorius*. The dried flowers afford a red colour, exceeding in delicacy and beauty, as it does in costliness. It is principally employed for imitating upon silk the fine scarlet, (*ponceau*) of the French, and rose colours dyed with cochineal upon woollen cloth. Saffron is used in medicine and the arts, but in this country the consumption seems to be diminishing. It is also employed in cookery and confectionary, to colour butter and cheese, and by painters and dyers. It is chiefly imported from the south of Europe, especially Spain, but the English saffron, as being of a superior quality, is always preferred. It is often adulterated with the petals of other plants, especially with those of the marigold. The *bastard saffron* is of the genus Carthamus, and the *meadow saffron* of the genus Colchicum.

Sago Palm (Sagus genuina.)

100 to 800 lbs. of sago. The tree when at maturity is about 30 feet high, and from 18 to 22 inches in diameter. The sago or medullary matter, which is prepared by the plant for the use of the flowers and fruit, is most abundant just before the evolution or appearance of the spadix or flower-bud. At this period the tree is cut down and the medullary part extracted from the trunk, and reduced to powder like saw-dust. The filaments are next separated by washing, and the meal laid to dry. For exportation, the finest sago meal is mixed with water, and then rubbed into small grains of the size and form of coriander seeds. This is the kind principally brought to England. Of late years the Chinese have invented a process for refining sago, and giving it a fine pearly lustre; the sago so cured is in the highest estimation in all the European markets. SALT, *n.* [Sax. *salt*, *sealt*; G. *salz*; Fr. *sel*; L. Sp. and Port. *sal*; Gr. ἁλς; W. *halen*; Corn. and Arm. *halinn*, from *whâl*, salt, a pervading substance. The radical sense is, probably, pungent, and if *s* is radical, the word belongs to the root of L. *salio*; but this is uncertain.] 1. Common salt is the chloride of sodium, formerly termed muriate of soda, a substance which has been known, and in common use, as a seasoner and preserver of food from the earliest ages. It is formed when chlorine and sodium or hydro-

chloric acid and soda come together. It possesses a crystalline structure, derived from the cube which is its primitive form. When in a state of purity it consists of 60 of chlorine, and 40 of sodium, in 100 parts. It is found in immense quantity dissolved in sea water, and in the water of salt springs, and in smaller quantity in all natural waters, by which, indeed, it is carried to the sea, where it accumulates. Salt is also found abundantly, as rock salt, in various countries, from fossil beds, or, as they are termed, salt mines, which are situated between the coal formation and the lias. It is obtained from sea water by simple evaporation, either spontaneous, or with the aid of heat; but immense quantities are obtained from the salt mines in the neighbourhood of Northwich, in Cheshire, and the salt springs in Cheshire and Worcestershire furnish a large proportion of the salt made use of in Great Britain. One chief use of salt is as an antiseptic in curing meat, but its most important use is as a condiment to food, or rather as a substance indispensable to digestion. It is also employed to yield hydrochloric acid, and chlorine for the making of bleaching powder, as well as the best carbonate of soda. It forms a glaze for coarse pottery; it improves the whiteness and clearness of glass; it gives hardness to soap; it is used as a mordant, and for improving certain colours; and enters more or less into many other processes of the arts.—2. In *chem.*, a term applied to all combinations of acids with alkaline or salifiable bases. The term has also been extended to certain binary combinations of chlorine, iodine, bromine, and fluorine, with the metals, and these have been termed *haloid* salts. [*See* HALOID.] Certain definite combinations of the sulphurets with each other, have of late been called *sulphur salts*. Turner, in his Chemistry, groups together all saline compounds which have a certain similarity of composition into one great class of *salts*, which he divides into the four following orders:—1. The oxy-salts. This order includes no salt the acid or base of which is not an oxidized body; as for example, when sulphuric acid unites with soda, the result being sulphate of soda. 2. The hydro-salts. This order includes no salts, the acid or base of which does not contain hydrogen. 3. The sulphur-salts. This order includes no salt, the electro-positive or negative ingredient of which is not a sulphuret. Such salts are, in this country, generally classed together as double sulphurets: thus, copper pyrites; or double sulphuret of iron and copper, is a sulphur-salt. 4. The haloid salts. This order includes no salt the electro-positive or negative ingredient of which is not haloid: thus, the whole series of the metallic chlorides, iodides, bromides, and fluorides, are *haloid salts*. Salts have been conveniently, though not quite correctly, divided into alkaline, earthy, and metallic salts; for, strictly speaking, most of the two former belong to the latter, and to these classes must be added ammonaical salts, and the salts of the vegetable alkalies. The nomenclature of salts has reference to the acids which they contain. For example, *sulphates*, *nitrates*, *carbonates*, &c., imply salts of the sulphuric, nitric, and carbonic acids. The termination *ate* implies the maximum of oxygen in the acids, and *ite* the minimum. If neither the acid nor base of a salt be in excess, it is termed a *neutral salt*; if the acid predominate, it is called an *acid salt*, a *bi salt*, or a *super salt*, and if the base prevail, it is called a *basic salt*, or a *sub-salt*. Many salts are *hydrous*, that is, they contain a definite proportion of water of crystallization; others are dry or *anhydrous salts*. Some salts attract moisture when exposed to air, and are called *deliquescent*; others suffer their water to escape, and become opaque or pulverulent: these are called *efflorescent salts*. The combination of salts with each other gives rise to compounds called *double* salts; as the sulphate of lime and soda, the boro-fluoride of potassium, &c. Most of the double salts hitherto examined consist of the same acid and two different bases. The neutral state of salts is commonly indicated by their solutions not changing the colours of litmus, violets, or red cabbage; the sub-state of salts, by their turning the colours of violets and cabbage into green; and the super-state of salts, by their changing the purple of litmus, violets, and cabbage into red; but to the generality of this criterion there are some exceptions. According to the views of modern chemists, all true acids are hydrogen compounds, and all their salts compounds of metals with radicals, simple or compound. Hence they define an acid to be "the hydrogen compound of a simple or compound radical, possessing the power of neutralizing bases;" and a salt, "the compound formed by replacing the hydrogen of an acid by a metal."—3. SAND, *n.* [Sax. *sand*; G. Sw. and Dan. *sand*; D. *zand*.] 1. Any mass or collection of fine particles of stone, particularly of fine particles of silicious stone, but not strictly reduced to powder or dust. A mass of any comminuted minerals is, in popular language, called sand, but the most abundant ingredient in the extensive sands of the deserts is granular quartz, or flint. Most of the sands which we observe, whether on the surface of the ground, or in strata at a certain depth, whether forming the beds of rivers or the shores of the sea, are the ruins of disintegrated rocks, and are red, white, grey or black, according to the rocks from which they were derived, such as granitic, porphyritic, and other pyrogenous rocks. Soil often contains sand, though the subjacent strata be wholly calcareous or finely argillaceous. Valuable metallic ores, as those of gold, platinum, tin, copper, iron, titanium, often occur in the form of sand or mixed with that substance. Pure silicious sands are very valuable for the manufacture of glass, for making mortars, filters, ameliorating dense clay soils, for making moulds in founding, and many other purposes.—2. *Sands*, in the plural, tracts of land consisting of sand, like the deserts of Arabia and Africa, as the Libyan *sands*.

When the sandal tree becomes old, the harder central wood acquires a yellow colour and great fragrance, while the softer exterior wood remains white and destitute of fragrance. The former is what is called yellow sandal wood, and the latter white sandal wood. Some botanists, however, are of opinion that the yellow sandal wood is the produce of a

Sandal wood (Santalum album).

different tree. It is the yellow wood only, which is highly esteemed for its perfume, and which is considered so valuable for musical instruments, boxes, cabinets, &c. This article grows chiefly on the coast of Malabar and in the Indian Archipelago. [*See* SANTALUM.] *Red sandal* wood, or *Red sanders Wood* is the produce of a tree of the genus Pterocarpus, the *P. santalinus*, a native of India. It is used as a dye-wood, and as a slight astringent in medicine. In India, it is employed, along with one-tenth of Sapan wood, principally for dyeing silk and cotton. The colouring principle is called *Santaline.* [*See* PTEROCARPUS.]

SAN'DARAC, SAN'DARACH, *n.* [L. *sandaraca;* Ar. *sandros.*] 1. A resin in white tears, more transparent than those of mastic. It is used in powder, and mingled with a little chalk, to prevent ink from sinking or spreading on paper. This is the substance denoted by the Arabic word, and it is also called *varnish*, as it enters into the preparations of varnish. [*See* POUNCE.]—2. It is sometimes called false mangosteen, from some resemblance to its fruit, and also Indian sandal wood.

SAND'STONE, *n.* [*sand* and *stone.*] Stone composed of agglutinated grains of sand, which may be calcareous, silicious, or of any other mineral nature. Sandstone is in most cases chiefly composed of particles of quartz, united by a cement. The cement is in variable quantity, and may be calcareous or marly, argillaceous, or argillo-ferruginous or even silicious. The grains of quartz are sometimes scarcely distinguishable by the naked eye, and some-

times are equal in size to a nut or an egg; as in those sandstones called *conglomerates*, and sometimes pudding stone or breccia. The texture of some sandstones is very close, while in others it is very loose and porous. Some sandstones have a slaty structure, and have been called sandstone slate. In colour sandstone varies from gray to reddish brown, in some cases uniform, in others variegated. In addition to quartz, some sandstones contain grains of feldspar, flint, and silicious slate, or plates of mica. Some sandstones are ferruginous, containing an oxide or the carbonate of iron. Sandstone, though a secondary rock, has been formed at different periods and under different circumstances, and is hence associated with different rocks or formations. It is in general distinctly stratified, and the beds horizontally arranged, but sometimes they are much inclined, or even vertical. The strata of the new red sandstone are found lying immediately above the coal measures. It is a conglomerate. The old red sandstone forms the lowest member of the carboniferous group, and lies above the silurian rocks. It consists of many varieties and alternations of silicious sandstones and conglomerates of various colours, red predominating. It sometimes contains metallic substances, disseminated through the mass, or in beds or veins. Among these are sulphurets of iron, mercury, lead, and copper, and arsenical cobalt. Various organic remains occur in sandstone, among which are reeds, impressions of leaves, trunks of trees, and shells, both fluviatile and marine. Sandstone in some of its varieties is very useful in the arts, and is often known by the name of *freestone.* When sufficiently solid it is employed as a building stone. Some varieties are used as mill-stones for grinding meal, or for wearing down other materials preparatory to a polish, and some are used for whetstones.

SAP, *n.* [Sax. *sæp*; G. *saft*; Fr. *seve*; Arm. *sabr*; probably from softness or flowing. Qu. Pers. *zabah*, a flowing.] 1. The juice of plants of any kind. The fluid which plants imbibe from the soil in which they are placed, and the great source from which they are nourished, and their various peculiar secretions produced. The constituents of sap may be divided into those which are necessary for the growth of all plants, which are carbon, oxygen, hydrogen, and nitrogen; and those which are necessary only for the growth of particular plants or families of plants, such as the oxides of potassium, sodium, calcium, and magnesium. The sap is absorbed by the roots from the soil and then sent upwards into the stem towards the leaves. It is afterwards conveyed back from the leaves, when it is assimilated and altered, to the bark. In its crude state it consists of little except water holding earthy and gaseous matter in solution; especially carbonic acid; but as it rises through the tissue of the stem, it dissolves the secretions it meets with in its course, and thus acquires new properties, so that by the time it reaches the leaves it is entirely different from its state when it first enters the root. It is not certainly known through what kind of tissue the upward motion of the sap takes place, but it is most probable that all the tissues of a plant are engaged in conveying sap, with the exception of the spiral vessels, which seem appropriated to the conveyance of air. The sap, on arriving in the leaves, undergoes a diminution of its mass by the exhalation of a great part of the water which served as the vehicle of the nutritious substances contained in it. The remaining portion undergoes a further change by respiration. The sap, thus altered by respiration in the leaves and other green parts, descends into the stem and root, and is rendered subservient to the development of all the organs. *See* RESPIRATION, TRANSPIRATION, FOOD, NUTRITION.—2. The alburnum of a tree; the exterior part of the wood, next to the bark.—[*A sense in general use.*]

The berries are red and saponaceous, on which account they have been employed for washing cloths of various kinds in the West Indies, the continent of America, Java, and India. The fleshy part of these berries is viscid and in drying assumes a shining transparent appearance, and when rubbed with water it forms a lather like soap. This is owing to the presence of a principle called *Saponine*,—*which see*. According to the same act, it is no longer necessary to proceed to the lands, and deliver earth and stone &c., in the presence of two male witnesses, it being held sufficient to produce to a notary the precept of sasine (*See* PRECEPT OF SASINE), and relative writs, and record an instrument signed by the notary and witnesses, which instrument is to be recorded as the instrument of sasine. SAW, *pret.* of *See.*

SAW, *n.* [Sax. *saga;* G. *säge;* Fr. *scie.* See the Verb.] 1. A cutting instrument consisting of a blade or thin plate of iron or steel, with one edge dentated or toothed. The saw is employed to cut wood, stone, ivory, and other solid substances. The best saws are of tempered steel, ground bright, and smooth. They are of various forms and sizes, according to the purposes to which they are to be applied. Those used by carpenters and other artificers in wood are the most numerous. Among these are the following:—The *cross-cut saw*, for cutting logs transversely, and wrought by two persons, one at each end. The *pit saw*, a long blade of steel with large teeth and a transverse handle at each end; it is used in saw-pits for sawing logs into planks or scantlings, and is wrought by two persons. The *frame saw*, consisting of a blade from 5 to 7 feet long, stretched tightly in a frame of wood. It is used in a similar manner to the pit saw. The *ripping saw, half-ripper, hand-saw*, and *panel saw* are saws for the use of one person, the blades tapering in length from the handle. *Tenor saws, sash-saws, dove-tail-saws*, &c., are saws made of very thin blades of steel, stiffened with stout pieces of brass, iron, or steel fixed on their back edges. They are used for forming the shoulders of tenons, dove-tail joints, &c., and for many other purposes for which a neat clean cut is required. *Compass* and *key-hole saws* are long narrow saws, tapering from about an inch to an eighth of an inch in width, and used for making curved cuts. The key-hole saw is inserted in a long hollow handle, and by a screw it is fixed in any required place, from which it may be made to project more or less, as required. Small *frame-saws* and *bow-saws*, in which very thin narrow blades are tightly stretched, are occasionally used for cutting both wood and metal. Saws for cutting stone are without teeth.—2.† A saying; proverb; maxim; decree. [*See* SAY.]

SAW, *v. t. pret. sawed; pp. sawed* or *sawn.* [G. *sägen;* It. *segare*, to saw, cut, reap; L. *seco;* Fr. *scier;* allied to *sickle.*] 1. To cut with a saw; to separate with a saw; as, to *saw* timber or marble.—2 To form by cutting with a saw; as, to *saw* boards or planks; that is, to *saw* timber into boards or planks.

SAW, *v. i.* To use a saw; to practise sawing; as, a man *saws* well.—2. To cut with a saw; as, the mill *saws* fast or well.—3. To be cut with a saw; as, the timber *saws* smooth.

Saw Fish (Pristis cirratus).

Pristis, belonging to the fixed-gilled chondropterygians, nearly related, on the one hand, to the sharks, and on the other, to the rays. It has a long beak or snout, with spines growing like teeth on both edges, and four or five spiracles or breathing holes in the sides of the neck.

SAW'-FLY, *n.* A genus of flies, (*Tenthredo* of Linn.) belonging to the modern family Tenthredinidæ, distinguished by their large wings with many cells, the abdomen united to the body by its whole breadth, and terminated on the under side by a pair of organs (ovipositors) which are employed in the act of depositing the eggs in the bark of trees, the twigs of various plants, or within the epidermis of the leaves, something in the same manner as the common hand-saw of mechanics. Thirty British species have been described, some of which, in their larva state, do great mischief to plants.

SAW'-GIN, *n.* A machine used to divest cotton of its husk and other superfluous parts.

SAW'-MILL, *n.* A mill for sawing timber, and driven by water or steam. There are two distinct kinds of saw-mills, the *circular* and the *reciprocating.* In the first kind the cutting instrument is a circular plate revolving upon its axis, and having teeth upon its circumference, so that it cuts by a continuous rotatory motion. In the reciprocating saw-mills the cutting instrument operates in the same manner as the common pit or frame-saw, but several saws may be connected together and moved by the same machinery. The circular saw-mills are for the most part used for cutting up timber of small dimensions, or for cutting veneers or very thin boards. Reciprocating saw-mills are used for large timber, in forming beams, rafters, planks, &c., out of large timber.

SAW'-PIT, *n.* A pit over which timber is sawed by two men, one standing below the timber and the other above

SAW'YER, *n.* One whose occupation is to saw timber into planks or boards, or to saw wood for fuel.—2. In *America*, a tree which, being undermined by a current of water, and falling into the stream, lies with its branches above water, which are continually raised and depressed by the force of the current, from which circumstance the name is derived. The *sawyers* in the Mississippi render the navigation dangerous, and frequently sink boats which run against them.

The flowers are usually white, delicate, and beautiful. The species inhabit the mountainous districts of Europe and the northern parts of the world. According to De Candolle the whole order is more or less astringent. The root of *Heuchera Americana* is a powerful astringent, and called in North America *alum root*.

SAX'IFRAGE, *n.* [L. *saxifraga;* composed of *saxum*, a stone, and *frango*, to break.] A medicine that has the property of breaking or dissolving the stone in the bladder. But in *bot.*, the anglification of Saxifraga, a genus of plants, of the class Decandria, and order digynia, Linn.; nat. order Saxifragaceæ. The species are mostly inhabitants of alpine and subalpine regions, of the colder and temperate parts of the northern zone. Most of them are true rock plants, and many are well known as ornamental plants in our gardens, as *S. umbrosa*, London pride, or none-so-pretty; *S. granulata*, white or granulated meadow saxifrage; *S. cotyledon*, or pyramidal saxifrage; *S. hypnoides*, mossy saxifrage or ladies' cushion; *S. crassifolia*, or thick-leaved saxifrage; *S. sarmentosa*, or Chinese saxifrage. Twenty-five species of saxifrage have been enumerated by British botanists. These plants were formerly supposed to be good against the stone in the bladder; hence the name. The *burnet saxifrage* is of the genus Pimpinella; the *golden saxifrage* is of the genus Chrysosplenium; the *meadow saxifrage* is of the genus Peucedanum.

SAY, *v. t. pret.* and *pp. said*, contracted from *sayed*. [Sax. *sægan*, *secgan;* G. *sagen;* Ch. סוכה, *sucha*, to speak or say. The same verb in Arabic, *sauga*, signifies to *sink*, Goth. *sigcan*. The sense of the root is to throw or thrust.] 1. To speak; to utter in words; as, he *said* nothing; he *said* many things; he *says* not a word. *Say* a good word for me. It is observable that although this word is radically synonymous with *speak* and *tell*, yet the uses or applications of these words are different. Thus, we say, to *speak* an oration, to *tell* a story; but in these phrases, *say* can not be used. Yet to *say* a lesson is good English, though not very elegant. We never use the phrases, to *say* a sermon or discourse, to *say* an argument, to *say* a speech, to *say* testimony. A very general use of *say* is to introduce a relation, narration, or recital, either of the speaker himself or of something said or done, or to be done by another. Thus, Adam *said*, This is bone of my bone; Noah *said*, Blessed be the Lord God of Shem. If we *say* we have no sin, we deceive ourselves. *Say* to the cities of Judah, Behold your God. I can not *say* what I should do in a similar case. *Say* thus precedes a sentence. But it is perhaps impracticable to reduce the peculiar and appropriate uses of *say*, *speak*, and *tell* to general rules. They can be learnt only by observation.—2. To declare; Gen. xxxvii.—3. To utter; to pronounce.

> *Say* now Shibboleth, Judg. xii

4. To utter, as a command.

> God *said*, Let there be light; Gen. i.

5. To utter, as a promise; Luke xxiii.—6. To utter, as a question or answer; Mark xi.—7. To affirm; to teach; Matth. xvii.—8. To confess; Luke xvii.—9. To testify; Acts xxiv.—10. To argue: to allege by way of argument.

> After all that can be *said* against a thing
> *Tillotson.*

11. To repeat; to rehearse; to recite; as, to *say* a lesson.—12. To pronounce; to recite without singing. Then shall be *said* or sung as follows.—13. To report; as, in the phrases, it is *said*, they *say*.—14. To answer, to utter by way of reply; to tell.

> *Say*, Stella, feel you no content,
> Reflecting on a life well spent? *Swift.*

Note.— This verb is not properly intransitive. In the phrase, "as when we *say*, Plato is no fool," the last clause is the object after the verb; that is, "we *say* what follows." If this verb is properly intransitive in any case, it is in the phrase, "that is to *say*," but in such cases, the subsequent clause is the object of the verb, being that which is said, uttered, or related.

SCALD, *v.t.* [It. *scaldare;* Fr. *echauder*, for *eschalder;* Ir. *sgallaim;* from the root of L. *caleo, calda, calidus*. Probably the primary sense of *caleo* is to contract, to draw, to make hard.] 1. To burn or painfully affect and injure by immersion in or contact with a liquor of a boiling heat, or a heat approaching it; as, to *scald* the hand or foot. We *scald* the part when the heat of the liquor applied is so violent as to injure the skin and flesh. *Scald* is sometimes used to express the effect of the heat of other substances than liquids.

2. The sign of the Balance, or Libra, in the zodiac.—3. The small shell or crust which composes a part of the covering of a fish; and hence, any thin layer or leaf exfoliated or separated; a thin lamina; as, *scales* of iron or of bone. The *scales* of fish consist of alternate layers of membrane and phosphate of lime. The *scales* of serpents are composed of a horny membrane, without the calcareous phosphate. The *scales* of plants are thin flat, membranous, scurf-like processes, formed of cellular tissue.—4. A ladder; series of steps; means of ascending. [L. *scala*.]—5. The act of storming a place by mounting the walls on ladders; an escalade, or scalade. —6. In *math.*, a *scale* is any line drawn upon wood, ivory, or other solid substance, and divided into parts equal or unequal, the lengths of which may be taken off by the compasses, and transferred to paper, in aid of any geometrical construction. The manner in which the scale is divided depends of course upon the nature of the algebraical or trigonometrical expression, the values of which are to be represented. The most simple of all scales is that in which the divisions are equal, or, as it is called, a scale of equal parts. The term *scale*, however, is generally applied to a thin flat rule of wood, ivory, or metal, and of a rectangular form, having an assemblage of lines and figures engraved on it, for the purpose of measuring distances, extent, proportions, &c.; the lines being variously divided according to the purpose which the instrument is intended to serve.—*Plain scale*, a flat rule, one or two feet in length, and about two inches broad. It has drawn upon it lines of equal parts; lines of chords, sines, tangents, secants, &c.—*Gunter's scale*, a large plain scale usually two feet long and an inch and a half broad. On one side of it are placed the natural lines; as the line of chords, the line of sines, tangents, rhombs, &c.; and on the other the corresponding logarithmic lines. By means of these lines the various problems in trigonometry may be solved, with the aid of a pair of compasses. Gunter's scale is used specially for solving questions in navigation.—*Diagonal scale*. [*See under* DIAGONAL.] The word *scale* is used in mensuration to signify a line or rule of a definite length divided into a given number of equal parts, and used for the purpose of measuring other linear magnitudes. It becomes a *standard scale*, when all its divisions have been examined and compared with some standard measure. The scales of thermometers are graduated from some arbitrary point, or *zero* (as that which indicates the temperature of freezing water), from which the temperature is counted upwards or downwards in degrees, which are also arbitrary. Scales of equal parts, marked upon plans, drawings, are lines explanatory of the real dimensions of the objects delineated, instead of their actual dimensions on the paper.—7. Regular gradation; a series rising by steps or degrees like those of a ladder. Thus, we speak of the *scale* of being, in which man occupies a higher rank than brutes, and angels a higher rank than man.—8. Any instrument, figure, or scheme graduated for the purpose of measuring extent or proportions; as a map drawn by a *scale* of half an inch to a league. —9. In *music*, a gamut; a diagram; or a series of lines and spaces rising one above another, on which notes are placed; or a scale consists of the regular gradations of sounds. A *scale* may be limited to an octave, called by the Greeks a tetrachord, or it may extend to the compass of any voice or instrument. [*See* DIATONIC, CHROMATIC.]—10. Any thing graduated or marked with degrees at equal distances. —*Scale of equivalents*, in *chem.*, an instrument devised by Wollaston, consisting of a flat scale with a slide, having engraved on it a table of equivalents, comprehending all those substances

which are most frequently employed by chemists in the laboratory. From the mathematical construction of the scale, it not only serves the same purpose as other tables of equivalents, but in many instances it supersedes the necessity of calculation. Thus, if it is required to determine how many parts of sulphuric acid, and how many of potassa are contained in 100 parts of sulphate of potassa, it is only necessary to move the slide until 100 marked upon it is in a line with the name sulphate of potassa, on the fixed part of the scale, and the numbers on the slide opposite to the terms sulphuric acid and potassa, will give the precise quantity of each contained in 100 parts of the compound. In the original scale of Wollaston, oxygen is taken as the standard of comparison; but hydrogen may be selected with equal propriety, and scales of this kind have been prepared by Reid of Edinburgh. [*See* EQUIVALENT.]—11. In *arith.*, the order of progression on which any system of notation is founded; as, the *binary scale*, *denary scale*, &c.

SCALE, *v. t.* [It. *scalare*, from *scala*, a ladder.] 1. To climb, as by a ladder; to ascend by steps; *and applied to the walls of a fortified place*, to mount in assault or storm.

In *a general sense*, knowledge, or certain knowledge; the knowledge of many methodically digested and arranged so as to become attainable by one; the comprehension or understanding of truth or facts by the mind. The *science* of God must be perfect.—2. In *philosophy*, a collection of the general principles or leading truths relating to any subject. *Pure science*, as the mathematics, is built on self-evident truths; but the term science is also applied to other subjects founded on generally acknowledged truths, as *metaphysics*; or on experiment and observation, as *chemistry* and *natural philosophy*; or even to an assemblage of the general principles of an art, as the science of *agriculture*; the science of *navigation*. The knowledge of reasons and their conclusions, constitutes *abstract science*; that of causes and effects, and of the laws of nature, *natural* or *physical science*. The term science is often used to signify that which we know inductively, or by the experience of particulars, from which we ascend to general conclusions not necessarily constituted by those particulars, yet warranted by previous experience and by analogies widely observed. This signification of the term is applicable to *physical, moral, and practical science*.—*Physical* or *natural science* is that which is susceptible of experiment, and is therefore said to be founded on experimental evidence.—*Moral science*, is that which, lying in great part beyond the reach of experiment, rests for its certainty on aggregated facts, supported by concurrent testimony, by experience, and by analogy, so as to leave no room for doubt, though not demonstrable.—*Practical science*, is that which consists of general observations arising out of experience, and is otherwise called *theory* in correlation to an art or practice belonging to it. The term *science*, however, is more particularly used in contradistinction to *art* and *literature*. As distinguished from the former, *a science* is a body of truths, the common principles of which are supposed to be known and separated, so that the individual truths, even though some or all may be clear in themselves, have a guarantee that they could have been discovered and known either with certainty, or with such probability as the subject admits of, by other means than their own evidence. [*See* ART.] As distinguished from *literature*, science is applied to any branch of knowledge which is made the subject of investigation with a view to discover and apply first principles. [*See* LITERATURE.]

A principle in *science* is a rule in art. *Playfair.*

3. Art derived from precepts or built on principles.

Science perfects genius. *Dryden.*

5. One of the seven liberal branches of knowledge, viz., grammar, logic, rhetoric, arithmetic, geometry, astronomy, and music.

Note.—Authors have not always been careful to use the terms *art* and *science* with due discrimination and precision. Music is an *art* as well as a *science.* In general, an *art* is that which depends on practice or performance, and *science* that which depends on abstract or speculative principles. The *theory* of music is a *science;* the *practice* of it an *art.*

The screeds are 4, 5, or 6 feet apart, according to circumstances, and are accurately formed in the same plane by the plumb rule and straight edge. They thus form gauges for the rest of the work, and when they are ready, the panels or compartments between them are filled in flush with plaster, and a long float being made to traverse them, all the plaster which projects beyond them is struck off, and the whole surface reduced to the same plane.

SCREEN, *n.* [Fr. *ecran*. This word is evidently from the root of L. *cerno, excerno*, Gr. κρινω, to separate, to sift, to judge, to fight, contend, skirmish; Sp. *harnero*, a sieve. The primary sense of the root is to separate, to drive or force asunder, hence to sift, to discern, to judge, to separate, or cut off danger.] 1. Any thing that separates or cuts off inconvenience, injury, or danger; and hence, that which shelters or protects from danger, which hides, conceals, or prevents inconvenience. SCREW, *n.* [D. *schroef;* G. *schraube*. The primary sense is probably to turn, or rather to strain.] 1. A cylinder of wood or metal, consisting of a helical ridge or groove winding round a cylinder, so as to cut every line on the surface parallel to the axis, at the same angle. The screw forms one of the six mechanical powers, and is simply a modification of the inclined plane, as may be shewn by cutting a piece of paper in the form of a right angled triangle, so as to represent an inclined plane, and applying it to a cylinder with the perpendicular side of the triangle, or altitude of the plane, parallel to the axis of the cylinder. If the triangle be then rolled about the cylinder, the hypothenuse which represents the length of the plane will trace upon the surface of the cylinder a helical line, which, if we suppose it to have thickness, and to protrude from the surface of the cylinder, will form the thread of the screw. The energy of the power applied to the screw thus formed, is transmitted by means of a hollow cylinder of equal diameter with the solid or convex one, and having a helical channel cut on its inner surface so as to correspond exactly to the thread raised upon the solid cylinder. Hence the one will work within the other, and by turning the convex cylinder, while the other remains fixed, the former will pass through the latter, and will advance every revolution through a space equal to the distance between two contiguous threads. The convex screw is called the *male*, and the concave or hollow screw the *female screw*, or they are more frequently termed simply the screw and nut respectively. As the screw is a modification of the inclined plane, it is not difficult to estimate the mechanical advantage obtained by it. If we suppose the power to be applied to the circumference of the screw, and to act in a direction at right angles to the radius of the cylinder, and parallel to the base of the inclined plane by which the screw is supposed to be formed; then the power will be to the resistance as the distance between two contiguous threads, to the circumference of the cylinder. But as in practice, the screw is combined with the lever, and the power applied to the extremity of the lever, the law becomes: The power is to the resistance, as the distance between two contiguous threads, to the circumference described by the power. Hence the mechanical effect of the screw is increased by lessening the distance between the threads, or making them finer, or by lengthening the lever to which the power is applied. The law, however, is greatly modified by the friction, which is very great.—*Hunter's double screw*, a contrivance for increasing the power of the screw. It consists of a combination of two screws of unequal fineness, one of which works within the other, the external one being also made to play in a nut. In this case the power does not depend upon the intervals between the threads of either screw, but on the difference between the intervals in the two screws. Thus, if the external screw have 20 threads in an inch, and the internal 21, then in one revolution the external screw will descend through $\frac{1}{20}$ of an inch, and the internal will move in an opposite direction through $\frac{1}{21}$ of an inch, so that on the whole the internal screw will be depressed $\frac{1}{20}$ of an inch, and raised through $\frac{1}{21}$ of an inch by the external screw, and its actual depression will consequently be the excess of $\frac{1}{20}$ of an inch above $\frac{1}{21}$ of an inch, that is, $\frac{1}{420}$ of an inch. Hence it is easy to see that the power of this screw may be increased to almost any extent.—*Endless screw*, a screw combined with a wheel and axle in such a manner that the threads of the screw work into the teeth fixed on the periphery of the wheel. Such a combination may be employed for raising weights, or producing rotatory motion.—*Screw of Archimedes.* [*See* ARCHIMEDES' SCREW.]—*Micrometer screw*, a fine screw adapted to astronomical and optical instruments, for the purpose of measuring angles with great exactness; it is also used for sub-dividing a space into very minute equal parts, or for measuring minute spaces or distances.—*Screw-propeller*, an ingenious contrivance which has been recently applied with considerable success to supersede the use of paddles in the propulsion of vessels moved by steam power. A shaft furnished with broad helical arms is fitted to revolve in bearings in the dead-wood at the stern of the vessel, and is set in rapid motion

by the steam engines. This rotatory motion in the surrounding fluid, which may be considered to be in a partially inert condition, produces, according to the well known principle of the screw an onward motion of the vessel more or less rapid, according to the velocity of the shaft, the obliquity of the arms, and the weight of the vessel. The annexed figure shows the ordinary form and position of the screw-propeller.

Stern of Steam Vessel with Screw Propeller.

As a mechanical power, the screw has innumerable applications; but it is employed with most effect in all cases in which a very great pressure is required to be exerted within a small space, and without intermission. Hence it is the power generally used for expressing juices from solid substances, for compressing cotton and other goods into hard dense masses for the convenience of carriage, for coining, stamping, printing, &c. Machines of this kind are called *screw presses*.—*Screw nails* and *wood screws*, a kind of screws very much used by carpenters and other mechanics for fastening two or more pieces of any material together. When they are small they are turned by means of an instrument called a *screw driver*.—*Screw wrench or key*, a mechanical instrument employed to turn large screws or their nuts.

For this purpose tools are employed termed *taps* and *dies*, being simply counterparts in hard tempered steel of the screws to be produced, and formed with appropriate cutting edges. The motion of the machine forces the tap to penetrate the nut, and so form the screw in it, while the bolt is screwed by simply inverting this process, using the dies instead of the tap.

SCROF'ULA, *n.* [L. In G. *kropf* is crop, craw, and scrofula. In D. it is *kropzeer*, neck-sore.] A disease, consisting in hard indolent tumours of the conglobate glands in various parts of the body, but particularly in the neck, behind the ears and under the chin, which after a time suppurate and degenerate into ulcers, from which, instead of pus, a white curdled matter is discharged. Scrofula is not contagious, but it is often a hereditary disease; its first appearance is most usually between the third and seventh year of the child's age, but it may arise between this and the age of puberty; after which it seldom makes its first attack. It is promoted by every thing that debilitates, but it may remain dormant through life and not shew itself till the next generation. In mild cases the glands, after having suppurated, slowly heal; in others, the eyes and eyelids become inflamed, the joints become affected, the disease gradually extending to the ligaments and bones, and producing a hectic and debilitated state under which the patient sinks; or it ends in tuberculated lungs and pulmonary consumption. These verbs seem to be the same, with different prefixes, and from this evidently is derived *scythe*.] 1. An instrument for mowing grass, or cutting grain or other vegetables. It consists of a long curving blade with a sharp edge, made fast to a handle, and which is bent into a convenient form for swinging the blade to advantage. The blade is fixed to the handle, at an angle both to the plane of the blade and to the tangent to the curve of the blade. It is on the adjustment of these angles that the perfection of the instrument depends. Most scythes have two projecting handles fixed to the principal handle, by which they are held. The real line of the handle is that which passes through both the hands, and ends at the head of the blade. This may be a straight line or a crooked one, generally the latter, and by moving these handles up or down the main handle, each mower can place them so as best suits the natural size and position of his body. For laying the cut corn evenly, a scythe with the addition of a cradle, as it is called, is used. The cradle is a species of comb, with three or four long teeth parallel to the back of the blade, and fixed in the handle. The Hainault scythe is a scythe used with only one hand, and is employed when the corn is much laid and entangled. The person has a hook in one hand with which he collects a small bundle of the straggling corn, and with the scythe in the other hand cuts it. Another species of scythe, much used in Aberdeenshire, has a short branching handle somewhat in the shape of the letter Y, having two small handles fixed at the extremities of the two branches at right angles to the plane in which they lie. In *mythol*., Saturn or Time is represented with a scythe, the emblem of destruction.—2. The curved sharp blade used anciently in war chariots.

They delight in calms, and are fond of eddies and tide ways, where the ripple collects numerous fish and medusæ, on which they feed. The Hydrus Stokesii here depicted, inhabits

Sea Serpent (Hydrus Stokesii)

the Australian seas, and is as thick as a man's thigh.—2. An enormous marine animal resembling a serpent, said to have been repeatedly seen on the coasts of America. Some assert it to be 100 feet long, and others as many yards. All accounts, however, agree as to the protuberances on its back, its vertical sinuosities, and its serpent-shaped head. The following is a very likely account of the origin of this fabulous monster:—

"In the Sooloo seas, I have often witnessed the phenomenon which first gave origin to the marvellous stories of the great sea-serpent, namely, lines of rolling porpoises, resembling a long string of buoys, oftentimes extending seventy, eighty, or a hundred yards. These constitute the so-named protuberances of the monster's back, keep in close single file, progressing rapidly along the calm surface of the water, by a succession of leaps, or demi-vaults forwards, part only of their uncouth forms appearing to the eye. At the same moment, I have seen beautifully banded water-snakes, of the thickness of a man's leg, lying extended supinely along the glassy surface, or diving and swimming gracefully, with slow undulating lateral movements of their vertically compressed bodies."

The principal cause is no doubt the motion of the vessel, but it is often aggravated by the smells and effluvia of the vessel. The most effective antidote or remedy, consists in lying in a horizontal position. A common remedy among sailors, is a draught or two of sea water. The violence of the attacks not only varies in different individuals at different times, but the same person who escapes in one voyage shall suffer severely in another.

SEAL, *n.* [Sax. *seol, sele, syle;* Sw. *säl.*] The English name for a genus of marine carnivorous mammiferous quadrupeds, the Phoca of Linn., and now raised to the rank of a family under the name of Phocidæ. These animals are amphibious, most of them inhabiting the sea coasts, particularly in the higher latitudes. They have six or four incisors above, four or two below. Their hind feet are placed at

the extremity of the body, in the same direction with it, and serve the purpose of a caudal fin; the fore feet are also adapted for swimming, and furnished each with five claws; the external ears are either very small or wanting. The head of a seal bears a resemblance to that of a dog, whose intelligence and soft expressive look it also possesses. It is easily tamed, and soon becomes attached to its keeper or those who feed it. The seal not only furnishes food for the Esquimaux table, oil for his lamp, and clothing for his person; but even the bones and skin supply materials for his boats and his summer tents. There are numerous species; as the *leonina*, sometimes 18 feet in length, and the *jubata*, sometimes 25 feet in length, with a mane like a lion, both called *sea-lion*, and found in the

Marbled Seal (Phoca discolor.)

Pacific; and the common seal [*P. vitulina*,] from four to six feet in length, found generally throughout the Atlantic and the seas and bays communicating with it, covered with short, stiff, glossy hair, with a smooth head without external ears, and with the fore legs deeply immersed in the skin. As it frequents the British shores, the seal is well known and has been repeatedly described. Seals are principally hunted for their oil and skins. The skin, when tanned, is extensively employed in the making of shoes, and, when dressed with the hair on, serves for the covering of trunks, &c. In the arrangement of Cuvier, the morses, which form the genus Trichecus of Linn., are included among the Phocidæ.

SEAL, *n.* [Sax. *sigel, sigle*; G. *siegel*; Fr. *sceau*; L. *sigillum*. It is uncertain what was the original signification of *seal*, whether an image or some ornament. In Saxon, the word signifies a necklace, or ornament for the neck, a stud or boss, a clasp, and a seal.] 1. A piece of metal or other hard substance, usually round or oval, on which is engraved some image or device, and sometimes a legend or inscription for impressing the wax that makes fast a letter or other enclosed paper. In Scotland, royal grants are the only deeds which are authenticated by means of seals. In addition to the great seal and privy seal, there is the quarter seal, so called from its having been originally the quarter, and merely the testimonial of the great seal.—*Seal of cause*. In Scotland, most royal burghs, and many superiors of burghs of barony, have conferred upon them, in their charters, the power of constituting subordinate corporations or crafts. The grant or charter by which such a constitution is given, and which defines the privileges and powers to be possessed by the subordinate corporation, is called the *seal of cause*.—2. When the mixture has cooled down, it is either rolled into sticks or shaped in brass moulds.
